Manin’s and Peyre’s conjectures
on rational points and adelic mixing

SOCIÉTÉ MATHÉMATIQUE DE FRANCE
MANIN’S AND PEYRE’S CONJECTURES ON RATIONAL POINTS AND ADELIC MIXING*

BY ALEX GORODNIK, FRANÇOIS MAUCOURANT AND HEE OH

Dedicated to Prof. Gregory Margulis on the occasion of his sixtieth birthday

ABSTRACT. – Let \( X \) be the wonderful compactification of a connected adjoint semisimple group \( G \) defined over a number field \( K \). We prove Manin’s conjecture on the asymptotic (as \( T \to \infty \)) of the number of \( K \)-rational points of \( X \) of height less than \( T \), and give an explicit construction of a measure on \( X(\mathbb{A}) \), generalizing Peyre’s measure, which describes the asymptotic distribution of the rational points \( G(K) \) on \( X(\mathbb{A}) \). Our approach is based on the mixing property of \( L^2(G(K) \setminus G(\mathbb{A})) \) which we obtain with a rate of convergence.

RÉSUMÉ. – Soit \( X \) la compactification merveilleuse d’un groupe semi-simple \( G \), connexe, de type adjoint, algébrique défini sur un corps de nombre \( K \). Nous démontrons l’asymptotique conjecturée par Manin du nombre de points \( K \)-rationnels sur \( X \) de hauteur plus petite que \( T \), lorsque \( T \to +\infty \), et construisons de manière explicite une mesure sur \( X(\mathbb{A}) \), généralisant celle de Peyre, qui décrit la répartition asymptotique des points rationnels \( G(K) \) sur \( X(\mathbb{A}) \). Ce travail repose sur la propriété de mélange de \( L^2(G(K) \setminus G(\mathbb{A})) \), qui est démontrée avec une estimée de vitesse.

1. Introduction

Let \( K \) be a number field and \( X \) a smooth projective variety defined over \( K \). A fundamental problem in modern algebro-arithmetic geometry is to describe the set \( X(K) \) in terms of the geometric invariants of \( X \). One of the main conjectures in this area was made by Manin in the late eighties in [1]. It formulates the asymptotic (as \( T \to \infty \)) of the number of points in \( X(K) \) of height less than \( T \) for Fano varieties (that is, varieties with ample anti-canonical class).

Manin’s conjecture has been proved for flag varieties ([26], [41]), toric varieties ([3], [2]), horospherical varieties [52], equivariant compactifications of unipotent groups (see [13], [49], [47]), etc. We refer to survey papers by Tschinkel ([56], [57]) for a more precise background on this conjecture. Recently Shalika, Tschinkel and Takloo-Bighash proved the conjecture for the wonderful compactification of a connected semisimple adjoint group [48]. In this paper, we present a different proof of the conjecture, as well as describe the asymptotic distributions of rational points of bounded height as conjectured by Peyre. Our proof relies on the computation of the volume asymptotics of height balls in [48]. We refer to [33] for the comparison of these two approaches.

Although our work is highly motivated by conjectures in arithmetic geometry, our approach is almost purely (algebraic) group theoretic. For this reason, we formulate our main results in the language of algebraic groups and their representations in the introduction and refer to section 7 for the account that how these results imply the conjectures of Manin and Peyre.

1.1. Height function

We begin by defining the notion of a height function on the $K$-rational points of the projective $n$-space $\mathbb{P}^n$. Intuitively speaking, the height of a rational point $x \in \mathbb{P}^n(K)$ measures an arithmetic size of $x$. In the case of $K = \mathbb{Q}$, it is simply given by

$$H(x) = \max_{0 \leq i \leq n} |x_i|$$

where $(x_0, \ldots, x_n)$ is a primitive integral vector representing $x$. To give its definition for a general $K$, we denote by $R$ the set of all normalized absolute values $x \mapsto |x|_v$ of $K$, and by $K_v$ the completion of $K$ with respect to $|\cdot|_v$. For each $v \in R$, choose a norm $H_v$ on $K_v^{n+1}$ which is simply the max norm

$$H_v(x_0, \ldots, x_n) = \max_{0 \leq i \leq n} |x_i|_v$$

for almost all $v$. Then a function $H: \mathbb{P}^n(K) \to \mathbb{R}_{>0}$ of the following form is called a height function:

$$H(x) := \prod_{v \in R} H_v(x_0, \ldots, x_n)$$

for $x = (x_0 : \cdots : x_n) \in \mathbb{P}^n(K)$. Since $H_v(x_0, \ldots, x_n) = 1$ for almost all $v \in R$, we have $H(x) > 0$ and by the product formula, $H$ is well defined, i.e., independent of the choice of representative for $x$.

It is easy to see that for any $T > 0$, the number

$$N(T) := \# \{ x \in \mathbb{P}^n(K) : H(x) < T \}$$

is finite. Schanuel [45] computed the precise asymptotic in 1964:

$$N(T) \sim c \cdot T^{n+1} \quad \text{as } T \to \infty$$

for some explicit constant $c = c(H) > 0$.

Unless mentioned otherwise, throughout the introduction, we let $G$ be a connected semisimple adjoint group over $K$ and $\iota: G \to \text{GL}_N$ be a faithful representation of $G$ defined over $K$ with a unique maximal weight. Consider the projective embedding of $G$ over $K$ induced by $\iota$:

$$\bar{\iota}: G \to \mathbb{P}(M_N)$$
where \( M_N \) denotes the space of matrices of order \( N \). We then define a height function \( H_\iota \) on \( G(K) \) associated to \( \iota \) by pulling back a height function on \( \mathbb{P}(M_N(K)) \) via \( \iota \). That is, for \( g \in G(K) \),
\[
H_\iota(g) := \prod_{v \in R} H_v(\iota(g)),
\]
where each \( H_v \) is a norm on \( M_N(K_v) \), which is the max norm for almost all \( v \in R \).

We note that \( H_\iota \) is not uniquely determined by \( \iota \), because of the freedom of choosing \( H_v \) locally (though only for finitely many \( v \)).

1.2. Asymptotic number of rational points

For each \( T > 0 \), we introduce the notation for the number of points in \( G(K) \) of height less than \( T \):
\[
N(H_\iota, T) := \# \{ g \in G(K) : H_\iota(g) < T \}.
\]

**Theorem 1.2.** There exist \( a_\iota \in \mathbb{Q}^+, b_\iota \in \mathbb{N} \) and \( c = c(H_\iota) > 0 \) such that for some \( \delta > 0 \),
\[
N(H_\iota, T) = c \cdot T^{a_\iota (\log T)^{b_\iota - 1}} \cdot (1 + O((\log T)^{-\delta})).
\]

The constants \( a_\iota \) and \( b_\iota \) can be defined explicitly by combinatorial data on the root system of \( G \) and the unique maximal weight of \( \iota \). Choose a maximal torus \( T \) of \( G \) defined over \( K \) containing a maximal \( K \)-split torus and a set \( \Delta \) of simple roots in the root system \( \Phi(G, T) \). Denote by \( 2\rho \) the sum of all positive roots in \( \Phi(G, T) \), and by \( \lambda_\iota \) the maximal weight of \( \iota \).

Define \( u_\alpha, m_\alpha \in \mathbb{N}, \alpha \in \Delta \), by
\[
2\rho = \sum_{\alpha \in \Delta} u_\alpha \alpha \quad \text{and} \quad \lambda_\iota = \sum_{\alpha \in \Delta} m_\alpha \alpha.
\]
The fact that \( m_\alpha \in \mathbb{N} \) follows since \( G \) is of adjoint type. Consider the twisted action of the Galois group \( \Gamma_K := \text{Gal}(\overline{K}/K) \) on \( \Delta \) (for instance, if the \( K \)-form of \( G \) is inner, this action is just trivial). Then
\[
a_\iota = \max_{\alpha \in \Delta} \frac{u_\alpha + 1}{m_\alpha} \quad \text{and} \quad b_\iota = \# \left\{ \Gamma_K \cdot \alpha : \frac{u_\alpha + 1}{m_\alpha} = a_\iota \right\}.
\]

Note that the exponent \( a_\iota \) is independent of the field \( K \), and \( b_\iota \) depends only on the quasi-split \( K \)-form of \( G \). Therefore, by passing to a finite field extension containing the splitting field of \( G \), \( b_\iota \) also becomes independent of \( K \).

**Remark 1.1.** When \( G \) is almost \( K \)-simple or, more generally, when \( H_\iota \) is the product of height functions of the \( K \)-simple factors of \( G \), we can improve the rate of convergence in Theorem 1.2: for some \( \delta > 0 \),
\[
N(H_\iota, T) = c \cdot T^{a_\iota} P(\log T) \cdot (1 + O(T^{-\delta}))
\]
where \( P(x) \) is a monic polynomial of degree \( b_\iota - 1 \).
1.3. Distribution of rational points

For each \( v \in \mathbb{R} \), denote by \( X_{r,v} \) the closure of \( \mathbb{Z}(G(K_v)) \) in \( \mathbb{P}(\mathbb{M}_N(K_v)) \), and consider the compact space \( X_r := \bigcap_{v \in \mathbb{R}} X_{r,v} \). In section 6, we construct a probability measure \( \mu_r \) on \( X_r \) which describes the asymptotic distribution of rational points in \( G(K) \) in \( X_r \) with respect to the height \( H_r \). To keep the introduction concise, we give the definition of \( \mu_r \) only when \( r \) is saturated. A representation \( \iota : G \to \text{GL}_N \) is called saturated if the set

\[
\left\{ \alpha \in \Delta : \frac{u_\alpha + 1}{m_\alpha} = a_\xi \right\}
\]

is not contained in the root system of a proper normal \( K \)-subgroup of \( G \). In particular, if \( G \) is almost \( K \)-simple, any representation of \( G \) is saturated.

Let \( \tau \) denote the Haar measure on \( G(\mathbb{A}) \) such that \( \tau(G(K) \backslash G(\mathbb{A})) = 1 \). Denote by \( \Lambda \) the set of all automorphic characters of \( G(\mathbb{A}) \) (cf. section 2.4) and by \( W_i \) the maximal compact subgroup of the group \( G(\mathbb{A}_i) \) of finite adèles, under which \( H_r \) is \( \mathbb{A} \)-invariant (see Definition 2.7). Then the following is a positive real number (see Propositions 4.6 and 4.11 (3), noting \( r_i = \gamma_{W_i}(\iota) \) in the notation therein):

\[
r_i := \lim_{s \to \pm \infty} \left( s - a_\xi \right)^b \int_{G(\mathbb{A})} H_r(g)^{-s} \chi(g) \ d\tau(g).
\]

For \( \iota \) saturated, the probability measure \( \mu_\iota \) on \( X_r \) is the unique measure satisfying that for any \( \psi \in C(X_r) \) invariant under a co-finite subgroup of \( W_i \),

\[
\mu_\iota(\psi) = r_i^{-1} \left( s - a_\xi \right)^b \int_{G(\mathbb{A})} H_r(g)^{-s} \chi(g) \psi(g) \ d\tau(g)
\]

(see Theorem 4.18). We refer to (6.16) for the definition of \( \mu_\iota \) for a general \( \iota \):

**Theorem 1.6.** - For any \( \psi \in C(X_r) \),

\[
\lim_{T \to \infty} \frac{1}{N(H_r,T)} \sum_{g \in G(k) : H_r(g) < T} \psi(g) = \int_{X_r} \psi \ d\mu_\iota.
\]

**Remark 1.7.** -
1. For \( \iota \) saturated, the measure \( \mu_\iota \) coincides with the measure \( \bar{\mu}_\iota \) which describes the distribution of height balls in \( G(\mathbb{A}) \) (see Proposition 4.27).
2. Although the projection \( \mu_{i,S} \) of \( \mu_i \) to \( X_{r,S} = \prod_{v \in S} X_{r,v} \) is always equivalent to a Haar measure on \( G_S = \prod_{v \in S} G(K_v) \) (Proposition 4.22), it is \( G_S \)-invariant, only when the height \( H_{i,S} = \prod_{v \in S} H_v \) of \( \iota \) is \( G_S \)-invariant.
3. The space \( X_{r,S} \) is a compactification of \( G_S \) which is an analog of the Satake compactification defined for real groups (see, for example, [7]). Theorem 1.6 implies that the rational points \( G(K) \) do not escape to the boundary \( X_{r,S} \). It is interesting to compare this result with the distribution of the integral points \( G(\mathbb{Z}) \) of bounded height in the Satake compactification of \( G(\mathbb{R}) \) where the limiting distribution is supported on the boundary (see [29] and [38] for more details).
1.4. Counting and volume heuristic

To explain our strategy in counting $K$-rational points of $G$, we first recall the analogous results in counting integral points in a simple real algebraic group. Let $G \subset \text{GL}_N$ be a connected non-compact simple real algebraic group and $\Gamma$ be a lattice in $G$, i.e., a discrete subgroup of finite co-volume. Fixing a norm $\| \cdot \|$ on $M_N(\mathbb{R})$, set $B_T := \{ g \in G : \| g \| \leq T \}$. By Duke-Rudnick-Sarnak [22] and Eskin-McMullen [23] independently, it is well known that

(1.8) \[ \# \Gamma \cap B_T \sim \int_{B_T} \, dg \quad \text{as } T \to \infty, \]

where $dg$ is the Haar measure on $G$ such that $\int_{\Gamma \backslash G} \, dg = 1$.

Coming back to the question of counting rational points $G(K)$, we recall that $G(K)$ is a lattice in the adele group $G(\mathbb{A})$ when embedded diagonally and that the height function $H_\iota$ extends to $G(\mathbb{A})$.

If we set $B_T := \{ g \in G(\mathbb{A}) : H_\iota(g) < T \}$, then $B_T$ is a relatively compact subset of $G(\mathbb{A})$ (Lemma 2.5) and we have the equality

\[ N(H_\iota, T) = \# G(K) \cap B_T. \]

In view of (1.8), one naturally asks whether the following holds:

(1.9) \[ \# G(K) \cap B_T \sim \tau(B_T) \quad \text{as } T \to \infty. \]

It turns out that the group $G(\mathbb{A})$ is too big for (1.9) to hold in general, due to the presence of non-trivial automorphic characters of $G(\mathbb{A})$. For a compact open subgroup $W_f$ of $G(\mathbb{A}_f)$, denote by $\Lambda^{W_f} \subset \Lambda$ the set of all $W_f$-invariant characters in $\Lambda$. We set

\[ G_{W_f} := \ker(\Lambda^{W_f}) = \cap \{ \ker \chi \subset G(\mathbb{A}) : \chi \in \Lambda^{W_f} \}. \]

The subgroup $G_{W_f}$ is a normal subgroup of $G(\mathbb{A})$ with finite index (see Lemma 4.7), and hence $G(K)$ is a lattice in $G_{W_f}$. Denote by $\tau_{W_f}$ the Haar measure on $G_{W_f}$ normalized so that $\tau_{W_f}(G(K) \backslash G_{W_f}) = 1$.

**Theorem 1.10.** Assume that $\iota : G \to \text{GL}_N$ is saturated. Then for any compact open subgroup $W_f$ of $G(\mathbb{A}_f)$ under which $H_\iota$ is bi-invariant,

\[ \# G(K) \cap B_T \sim \tau_{W_f}(G_{W_f} \cap B_T). \]

We remark that one cannot in general replace $G_{W_f}$ by $G(\mathbb{A})$ (see example 4.24), and Theorem 1.10 does not hold for $\iota$ non-saturated.

As in the proof of Eskin-McMullen of (1.8), our key ingredient in proving Theorem 1.10 is the mixing theorem on $L^2(G(K) \backslash G_{W_f})$. 
1.5. Adelic mixing

Let $L^2_{00}(G(K)\backslash G(\mathbb{A}))$ denote the orthogonal complement in $L^2(G(K)\backslash G(\mathbb{A}))$ to the direct sum of all automorphic characters. In the case when $G$ is simply connected, $L^2_{00}(G(K)\backslash G(\mathbb{A}))$ coincides with the orthogonal complement $L^2_0(G(K)\backslash G(\mathbb{A}))$ to the constant functions.

Set $G_\infty := \prod_{v \in R_\infty} G(K_v)$ where $R_\infty$ is the subset of $R$ of all archimedean valuations.

**Theorem 1.11 (Automorphic bound for $G$).** Let $G$ be a connected absolutely almost simple $K$-group. Let $U_\infty$ be a maximal compact subgroup of $G_\infty$ and $W_f$ a compact open subgroup of $G(\mathbb{A}_f)$. Then there exist $c_{W_f} > 0$ and $r_0 > 0$ such that for any $U_\infty$-finite and $W_f$-invariant functions $\psi_1, \psi_2 \in L^2_{00}(G(K)\backslash G(\mathbb{A}))$,

$$|\{\psi_1, g.\psi_2\}| \leq c_{W_f} \cdot (\dim(U_\infty\psi_1) \cdot \dim(U_\infty\psi_2))^{r_0} \cdot \xi_G(g) \cdot \|\psi_1\|_2 \cdot \|\psi_2\|_2$$

for all $g \in G(\mathbb{A})$.

Here, $\xi_G : G(\mathbb{A}) \to (0, 1]$ is an explicitly constructed proper function which is $L^p$-integrable for some $p = p(G) < \infty$. (see Def. 3.20).

Using the restriction of scalars functor, we extend this theorem to connected almost $K$-simple adjoint (simply connected) groups (Theorem 3.22). The above bounds on matrix coefficients can also be extended to smooth functions in certain Sobolev spaces (see Theorem 3.27). We also mention a paper of Guilloux [30] where an application of Theorem 1.11 was discussed in local-global principle problems.

**Corollary 1.12 (Adelic Mixing).** Let $G$ be a connected absolutely simple $K$-group, or a connected almost $K$-simple adjoint (simply connected) $K$-group. Then for any $\psi_1, \psi_2 \in L^2_{00}(G(K)\backslash G(\mathbb{A}))$,

$$\langle \psi_1, g.\psi_2 \rangle \to 0$$

as $g \in G(\mathbb{A})$ tends to infinity.

Any $W_f$-invariant function in $L^2(G(K)\backslash G_{W_f})$ orthogonal to constants belongs to $L^2_{00}(G(K)\backslash G(\mathbb{A}))$ (see Lemma 4.12). Hence Corollary 1.12 implies that if $\psi_1$ and $\psi_2$ are $W_f$-invariant functions in $L^2(G(K)\backslash G_{W_f})$, then as $g \to \infty$,

$$\int_{G(\mathbb{A})\backslash G_{W_f}} \psi_1(x)\psi_2(xg) \, d\tau_{W_f}(x) \to \int \psi_1 \, d\tau_{W_f} \cdot \int \psi_2 \, d\tau_{W_f},$$

For each $v \in R$, denote $\hat{G}_v^{\text{aut}} \subset \hat{G}_v$ the automorphic dual of $G(K_v)$, i.e., the subset of unitary dual of $G(K_v)$ consisting of representations which are weakly contained in the representations appearing as $G(K_v)$ components of $L^2(G(K)\backslash G(\mathbb{A}))^{G_f}$ for some compact open subgroup $O_f$ of $G(\mathbb{A}_f)$. The proof of Theorem 1.11 goes roughly as follows: if $\xi_v$ is a uniform bound for the matrix coefficients of infinite dimensional representations in $\hat{G}_v^{\text{aut}}$, $\xi_G$ is defined to be the product $\prod_{v \in R} \xi_v$. This can be made precise using the language of direct integral of a representation (cf. proof of Theorem 3.10). For those $v \in R$ such that the $K_v$-rank of $G$ is at least 2, the uniform bounds, say $\xi_v$, of matrix coefficients of all infinite dimensional unitary representations of $G(K_v)$ were obtained by Oh [40]. For these cases, one can simply take $\xi_G = \xi_v$. In particular, if $K$-rank of $G$ is at least 2 and $G(K_v)^+$ denotes the closed subgroup of $G(\mathbb{A})$ generated by all unipotent elements in $G(K_v)$, we have $\xi_G = \prod_{v \in R} \xi_v$.
and \( \tilde{\xi}_G \) works as a uniform bound for all unitary representations of \( G(\mathbb{A}) \) without \( G(K_v)^+ \)-invariant vectors for each \( v \in R \) (see Theorem 3.10 for a precise statement). Moreover \( \tilde{\xi}_G \) is fairly sharp in these cases. For instance, one can show that \( \tilde{\xi}_G \) is optimal for \( G = \text{SL}_n \) \((n \geq 3)\), or \( \text{Sp}_{2n} \) \((n \geq 2)\) by [16, 5.4].

When there is \( v \in R \) with \( K_v \)-rank of \( G \) one, finding an automorphic bound \( \tilde{\xi}_v \) is essentially carried out by Clozel [15]. In particular, several deep theorems in automorphic theory were used such as the Gelbart-Jacquet bound [28] toward Ramanujan conjecture, the results of Burger-Sarnak [11] and Clozel-Ullmo [17] on lifting automorphic bounds, the base changes by Rogawski [44] and Clozel [14], and Jacquet-Langlands correspondence [33].

1.6. Organization of the paper

In section 2 we list some notations and preliminaries which will be used throughout the paper. In section 3, we discuss adelic mixing and prove Theorem 1.11. We also extend a theorem of Clozel-Oh-Ullmo on the equidistribution of Hecke points [16] in this section as an application of adelic mixing. In section 4, we deduce the volume asymptotics of height balls from the results in [48] and construct in subsection 4.4 the probability measure \( \tilde{\mu}_\iota \) on \( X_\iota \) which describes the asymptotic distribution of height balls in \( G(\mathbb{A}) \). The main theorem in section 5 is Theorem 5.2 on the equidistribution of rational points with respect to \( \tilde{\mu}_\iota \) for the case when \( \iota \) is saturated. Theorems 1.6 (saturated cases) and 1.10 follow from this theorem. In section 6, we prove Theorem 1.6 for general cases (Theorem 6.2) as well as Theorem 1.2 (Theorem 6.17). In section 7, we restate our main theorems in the context of Manin’s and Peyre’s conjectures.

1.7. Acknowledgments

We would like to thank Wee Teck Gan, Emmanuel Peyre and Yehuda Shalom for helpful conversations. We thank Ramin Takloo-Bighash for the useful comments on our preliminary version of this paper. We are also deeply grateful to the referee for many detailed comments on the submitted version.

2. Notations and Preliminaries

We set up some notations which will be used throughout the paper. Let \( K \) be a number field and \( G \) a connected semisimple group defined over \( K \). We denote by \( R_K \), or simply by \( R \), the set of all normalized absolute values on \( K \). We keep the same notation \( R, R_f,K \) as in the introduction.

2.1. Let \( \mathcal{O} \) denote the ring of integers of \( K \) and \( \mathcal{O}_v \) the valuation ring of \( K_v \). Set \( R_\infty = R - R_f \). For \( v \in R_f \), let \( q_v \) denote the order of the residue field of \( \mathcal{O}_v \). We choose an absolute value \( |\cdot|_v \) on \( K_v \) normalized so that the absolute value of a uniformizer of \( \mathcal{O}_v \) is given by \( q_v^{-1} \). Denote by \( \hat{\mathcal{O}} \) the adele ring over \( K \) and by \( G(\hat{\mathcal{A}}) \) the adele group associated to \( G \).

Denote by \( G(\mathbb{A}_f) \) (resp. \( G(\mathbb{A}_\infty) \)) the subgroup of finite (resp. infinite) adeles, i.e., \( (g_v)_{v} \in G(\mathbb{A}) \) with \( g_v = e \) for all \( v \in R_\infty \) (resp. for all \( v \in R_f \)). Then \( G(\hat{\mathcal{A}}) = G(\mathbb{A}_\infty) \times G(\mathbb{A}_f) \).
2.2. We fix a smooth model \( \mathcal{G} \) of \( G \) over \( \mathcal{O}[k^{-1}] \) for some non-zero \( k \in \mathbb{Z} \). There exists a finite subset \( S_0 \subset R_f \) such that for any \( v \in R_f - S_0 \), \( G \) is unramified over \( K_v \) and \( \mathcal{G}(\mathcal{O}_v) \) is a hyperspecial compact subgroup (cf. [55]). We set \( U_v = \mathcal{G}(\mathcal{O}_v) \) for each \( v \in R_f - S_0 \). Then for each \( v \in R_f - S_0 \), one has the group \( A_v \) of \( K_v \)-rational points of a maximal \( K_v \)-split torus of \( G \) so that the following Cartan decomposition holds:

\[
G(K_v) = U_v A^+_v U_v
\]

where \( A^+_v \) is a closed positive Weyl chamber of \( A_v \). More precisely, one can choose a system \( \Phi^*_v \) of positive roots in the set \( \Phi_v = \Phi(G(K_v), A_v) \) of all non-multipliable roots of \( G(K_v) \) relative to \( A_v \), so that

\[
A^+_v = \{ a \in A_v : \alpha(a) \geq 1 \text{ for each } \alpha \in \Phi^*_v \} \quad \text{for } v \text{ archimedean}
\]

\[
A^+_a = \{ a \in A_v : |\alpha(a)|_v \in g^0_v \text{ for each } \alpha \in \Phi^*_a \} \quad \text{otherwise}.
\]

For \( v \in S_0 \cup R_{\infty} \), there exists a good maximal compact subgroup \( U_v \) (cf. [40, 2.1] for definition) of \( G(K_v) \) such that

\[
G(K_v) = U_v A^+_v \Omega_v U_v
\]

where \( \Omega_v \) is a finite subset in the centralizer of \( A_v \) in \( G(K_v) \).

In particular for any \( g \in G(K_v) \), there exist unique \( a_v, d_v \in A^+_v \) and \( d_v \in \Omega_v \) such that

\[
g \in U_v a_v d_v U_v. \quad \text{For } v \in R_{\infty}, \text{ any maximal compact subgroup of } G(K_v) \text{ is a good maximal compact subgroup and } \Omega_v = \{ e \}.
\]

2.3. For a finite subset \( S \) of \( R \), let \( G^S \) denote the subgroup of \( G(\mathbb{A}) \) consisting of \( (g_v) \), with \( g_v = e \) for all \( v \in S \), and set \( G_S := \prod_{v \in S} G(K_v) \). Note that \( G(\mathbb{A}) = G_S G^S \). For each \( v \in R \), let \( \tau_v \), or \( d_{\tau_v} \), denote a Haar measure on \( G(K_v) \) such that \( \tau_v(U_v) = 1 \) whenever \( v \in R_f \). Then the collection \( \{ \tau_v : v \in R \} \) defines a Haar measure, say \( \tau \), on \( G(\mathbb{A}) \) (cf. [43, 3.5]). We will assume that \( \tau(G(K) \setminus G(\mathbb{A})) = 1 \). This is possible by replacing \( \tau_v, v \in R_{\infty} \) with a suitable multiple of it, since \( G(K) \) is a lattice in \( G(\mathbb{A}) \) (cf. [43, Theorem 5.3]).

We denote by \( \tau_S \) the product measure \( \prod_{v \in S} \tau_v \) on \( G_S \) and by \( \tau_S \) the Haar measure on \( G^S \) for which \( \tau, \tau_S, \tau_S \) are compatible with each other, i.e., \( \tau = \tau_S \times \tau_S \) locally.

2.4. An automorphic character of \( G(\mathbb{A}) \) is a continuous homomorphism from \( G(\mathbb{A}) \) to the unit circle \( \{ z \in \mathbb{C} : z \bar{z} = 1 \} \) which contains \( G(K) \) in its kernel. Each automorphic character \( \chi \) of \( G(\mathbb{A}) \) can be considered as a function on the quotient \( G(K) \setminus G(\mathbb{A}) \), and since \( \tau(G(K) \setminus G(\mathbb{A})) = 1 \), \( \chi \) belongs to \( L^2(G(K) \setminus G(\mathbb{A})) \) and \( \| \chi \|_2 = 1 \). Let \( \Lambda \) denote the set of all automorphic characters of \( G(\mathbb{A}) \). Note that any two distinct elements of \( \Lambda \) are orthogonal to each other. We then have an orthogonal decomposition

\[
L^2(G(K) \setminus G(\mathbb{A})) = L^2_{00}(G(K) \setminus G(\mathbb{A})) \oplus \bigoplus_{\chi \in \Lambda} C\chi.
\]

where \( \bigoplus_{\chi \in \Lambda} C\chi \) is the closure of the direct sum of \( C\chi \)’s, and \( L^2_{00}(G(K) \setminus G(\mathbb{A})) \) denotes its orthogonal complement in \( L^2(G(K) \setminus G(\mathbb{A})) \).

If \( G \) is simply connected, it follows from the strong approximation property that the only automorphic character of \( G(\mathbb{A}) \) is the trivial one and hence that \( L^2_{00}(G(K) \setminus G(\mathbb{A})) \) is the orthogonal complement to the space of constant functions (cf. Lemma 3.24).
2.5. – For any compact open subgroup $W_f$ of $G(\mathbb{A}_f)$, we denote by $W_f$ the set of all $W_f$-invariant characters in $\Lambda$, i.e., $W_f = \{ \chi \in \Lambda : \chi(w) = 1 \text{ for all } w \in W_f \}$. We set

\begin{equation}
G_{W_f} := \ker(W_f) = \cap\{ \ker \chi \subset G(\mathbb{A}) : \chi \in W_f \}.
\end{equation}

The subgroup $G_{W_f}$ is a normal subgroup of $G(\mathbb{A})$ with finite index (see Lemma 4.7), and hence $G(K)$ is a lattice in $G_{W_f}$. Denote by $\tau_{W_f}$ the Haar measure on $G_{W_f}$ normalized so that $\tau_{W_f}(G(K) \setminus G_{W_f}) = 1$.

2.6. – For a group $G$ of adjoint type, let $\iota : G \to \text{GL}_N$ be a faithful representation defined over $K$. We give a definition of a height function $H_v$ on $G(\mathbb{A})$ associated to $\iota$ which is slightly more general than those considered in the introduction. It is this class of the functions for which we prove our main theorems.

**Definition 2.3.** – A height function $H_v : G(\mathbb{A}) \to \mathbb{R}^+$ is defined by the product

\[ \prod_{v \in R} H_{v,v} \text{ where } H_{v,v} \text{ is a function on } G(K_v) \text{ for } v \in R \text{ satisfying the following:} \]

1. there exists a finite subset $S \subset R$ such that
\[ H_{v,v}(g) = \max_{ij} |(g)_{ij}|_v \text{ for all } v \in R - S; \]
2. for $v \in S$, there exists $C > 0$ such that
\[ C^{-1} \cdot \max_{ij} |(g)_{ij}|_v \leq H_{v,v}(g) \leq C \cdot \max_{ij} |(g)_{ij}|_v; \]
3. for any $v \in S \cap R_\infty$, there exists $b > 0$ such that for any small $\varepsilon > 0$,
\[ (1 - b \cdot \varepsilon) H_{v,v}(x) \leq H_{v,v}(gxh) \leq (1 + b \cdot \varepsilon) H_{v,v}(x) \]

for any $x \in G(K_v)$ and any $g, h$ in the $\varepsilon$-neighborhood of $e$ in $G(K_v)$ with respect to a Riemannian metric;
4. for any $v \in S \cap R_f$, $H_{v,v}$ is bi-invariant under a compact open subgroup of $G(K_v)$.

Note by (1) that for $(g_v) \in G(\mathbb{A})$, since $g_v \in G(\mathcal{O}_v)$ for almost all $v \in R_f$, $H_{v,v}(\iota(g_v)) = 1$ for almost all $v$ and hence the product $\prod_{v \in R} H_{v,v}(g_v)$ converges.

Note also that the class of height functions defined above does not depend on the choice of a basis of $K^N$.

We will need the following observation on heights:

**Lemma 2.4.** – Suppose that $\iota$ has a unique maximal weight. Let $G_1$ and $G_2$ be connected normal algebraic $K$-subgroups of $G$ with $G = G_1G_2$ and $G_1 \cap G_2 = \{ e \}$. There exists $\kappa > 1$ such that for any $g_1 \in G_1(\mathbb{A})$ and $g_2 \in G_2(\mathbb{A})$,
\[ \kappa^{-1} \cdot H_v(g_1)H_v(g_2) \leq H_v(g_1g_2) \leq \kappa \cdot H_v(g_1)H_v(g_2). \]

**Proof.** – Let $\lambda_i$ denote the highest weight of $\iota$. Then there exists a finite subset $S \subset R$ such that for any $v \in R - S$,
\[ G(K_v) = U_vA^+_vU_v \text{ and } H_v(\iota(g)) = |(\lambda_i(a))_v| \text{ for } g = u_1au_2 \in G(K_v) \]
where $U_v$ and $A^+_v$ are defined as in (2.2). In particular, it follows that for each $v \in R - S$, and for any $g_1 \in G_1(K_v)$ and $g_2 \in G_2(K_v)$,
\[ H_v(\iota(g_1g_2)) = H_v(\iota(g_1))H_v(\iota(g_2)). \]
On the other hand, for \( v \in S \), \( H_{v,v} \) is equivalent to \( \lambda_i \) in the sense that there exists \( \kappa_v > 1 \) such that
\[
\kappa_v^{-1} |\lambda_i(a)|_v \leq H_{i,v}(g) \leq \kappa_v |\lambda_i(a)|_v \quad \text{for} \quad g = u_1 adu_2 \in U_v A^+_v \Omega_v U_v = G(K_v).
\]
This implies the lemma.

For \( T > 0 \), set
\[
B_T := \{ g \in G(\mathbb{A}) : H_i(g) < T \}.
\]

**Lemma 2.5.** – 1. We have
\[
\delta_0 := \inf_{g \in G(\mathbb{A})} H_i(g) > 0.
\]

2. For each \( T > 0 \), \( B_T \) is a relatively compact subset of \( G(\mathbb{A}) \). In other words, the height function \( H_i : G(\mathbb{A}) \to [\delta_0, \infty) \) is proper.

**Proof.** – By Definition 2.6, there exists a finite subset \( S \) such that for all \( v \in R - S \), \( H_i(v(g)) \geq 1 \) for any \( g \in G(K_v) \). Let \( 0 < \delta \leq 1 \) be such that \( H_i(v(g)) \geq \delta \) for \( v \in S \) and \( \delta_1 = \delta^{-\#S} \). Then \( H_i(g) \geq \delta_1 \) for all \( g \in G(\mathbb{A}) \). Hence \( \delta_0 \geq \delta_1 > 0 \).

Note that
\[
B_T \subset G(\mathbb{A}) \cap \prod_v \{ g_v \in G(K_v) : H_i(v(g_v)) \leq \delta^{-1}T \}.
\]
Since for almost all \( v \in R_f, H_i(v(g_v)) \geq q_v \) whenever \( g_v \notin G(\mathcal{O}_v) \), it follows that for some finite subset \( S_1 \subset R \), we have
\[
B_T \subset \{ (g_v)_v \in G(\mathbb{A}) : H_i(v(g_v)) \leq \delta^{-1} T \text{ for } v \in S_1, \quad g_v \notin G(\mathcal{O}_v) \text{ otherwise} \}.
\]
Since the set \( \{ g_v \in G(K_v) : H_i(v(g_v)) \leq b \} \) is compact for any \( b > 0 \), it follows that \( B_T \) is a relatively compact subset of \( G(\mathbb{A}) \).

**Definition 2.7.** – For a height function \( H_i \) of \( G(\mathbb{A}) \), define \( W_{H_i} \), or simply \( W_i \), to be
\[
W_i = \{ w \in G(\mathbb{A}_f) : H_i(wg) = H_i(gw) = H_i(g) \quad \text{for all} \quad g \in G(\mathbb{A}) \}.
\]
It is easy to check that \( W_i \) is a subgroup of \( G(\mathbb{A}_f) \), and is compact by the above lemma. Hence \( W_i \) is the maximal compact open subgroup of \( G(\mathbb{A}_f) \) under which \( H_i \) is bi-invariant.

### 3. Adelic Mixing

#### 3.1. Definition and properties of \( \xi_G \)

Let \( G \) be a connected semisimple algebraic group defined over a number field \( K \). Let \( T \) denote the set of \( v \in R \) such that \( G(K_v) \) is compact, that is, \( U_v = G(K_v) \). It is well known that \( T \) is a finite set.

Denote by \( \Phi^+ \) the system of positive roots in the set of all non-multiplier roots of \( G(K_v) \) relative to \( A^+_v \) and choose a maximally strongly orthogonal system \( S_v \) in \( \Phi^+_v \) in the sense of [40] (where an explicit construction is also given). For \( v \in R - T \) and \( K_v \neq \mathbb{C} \), define the bi-\( U_v \)-invariant function \( \xi_v = \xi_{G(K_v)} \) on \( G(K_v) \) (cf. [40]): for each \( g = ka dk' \in U_v A^+_v \Omega_v U_v \),
\[
\xi_v(g) = \prod_{\alpha \in S_v} E_{PGL_2(K_v)}(\begin{pmatrix} \alpha(a) & 0 \\ 0 & 1 \end{pmatrix})
\]
where $\Xi_{\text{PGL}_2(K_v)}$ is the Harish-Chandra function of $\text{PGL}_2(K_v)$. If $K_v = \mathbb{C}$, set

$$\xi_v(g) = \prod_{\alpha \in S_v} \Xi_{\text{PGL}_2(\mathbb{C})} \left(\alpha(a) \begin{pmatrix} 0 & 1 \\ \alpha(a) & 0 \end{pmatrix}\right)^{n_\alpha}$$

where $n_\alpha = 1/2$ if $\alpha$ is a long root of $G$, when $G$ is locally isomorphic to $\text{Sp}_{2n}(\mathbb{C})$, and $n_\alpha = 1$ for all other cases. We set $\xi_v = 1$ for $v \in T$.

Since $0 < \xi_v(g_v) \leq 1$ for all $v \in R$ and $\xi_v(g_v) = 1$ for almost all $v$, the following function $\xi_G$ is well defined:

**Definition 3.1.** Define the function $\xi_G : G(\mathbb{A}) \to (0, 1]$ by

$$\xi_G(g) = \prod_{v \in R} \xi_v(g_v) \quad \text{for } g = (g_v)_v \in G(\mathbb{A}).$$

Set

$$U_f = \prod_{v \in R_f} U_v, \quad U_\infty = \prod_{v \in R_\infty} U_v, \quad \text{and } U = U_f \times U_\infty.$$  

Note also that $\xi_G$ is bi-$U$-invariant.

For $v \in R - T$, we set

$$\eta_v(ka dk') := \prod_{\alpha \in S_v} |\alpha(a)|_v$$

where $ka dk' \in U_v A_v^+ \Omega_v U_v$ for all $v$ with $K_v \neq \mathbb{C}$. As in the case of the definition of $\xi_v$, if $K_v = \mathbb{C}$ and for $ka k' \in U_v A_v^+ U_v$, we set

$$\eta_v(ka k') = \prod_{\alpha \in S_v} |\alpha^n(a)|_v$$

with the same $n_\alpha$ defined as before. If $v \in T$, we set $\eta_v = 1$.

**Lemma 3.3.** For any $\varepsilon > 0$, there is a constant $C_\varepsilon > 0$ such that for any $g = (g_v)_v \in G(\mathbb{A})$,

$$\prod_{v \in R} \eta_v(g_v)^{-1/2} \leq \xi_G(g) \leq C_\varepsilon \cdot \prod_{v \in R} \eta_v(g_v)^{-1/2 + \varepsilon}.$$  

In particular,

$$\xi_G(g) \to 0 \quad \text{as } g \to \infty \text{ in } G(\mathbb{A}).$$

**Proof.** For $v \in R - T$, it follows from the explicit formula for $\Xi_v$ (cf. [40, 3.8]) that for any $\varepsilon > 0$, there is a constant $C_{v, \varepsilon} > 0$ such that for any $g_v \in G(K_v),$

$$\eta_v(g_v)^{-1/2} \leq \xi_v(g_v) \leq C_{v, \varepsilon} \cdot \eta_v(g_v)^{-1/2 + \varepsilon}.$$  

Moreover one can take $C_{v, \varepsilon} = 1$ for almost all $v$. This implies (3.4).

To see the second claim, first note that for any $g \in G(\mathbb{A}),$

$$(3.5) \quad \xi_G(g) \leq \xi_v(g_v) \leq C_{v, \varepsilon} \cdot \eta_v(g_v)^{-1/2 + \varepsilon}.$$  

Now suppose on the contrary that there exists a sequence $\{g_i \in G(\mathbb{A})\}$ such that $g_i \to \infty$ and $\xi_G(g_i) \to 0$. Then by passing to a subsequence we may assume either that there is a place $v \in R$ such that $g_i, v \to \infty$ in $G(K_v)$ or that there exists a sequence $\{v_i \in R_f - S_0\}$ such that
This proves the claim.

In the second case, note that since \( g_{v_i} \notin U_{v_i} \) and \( \Omega_{v_i} = \{ e \} \), we have \( \eta_v(g_{v_i}) \geq q_{v_i} \) for each \( i \). Hence by (3.5) for all \( i \) big enough,

\[
\xi_G(g_i) \leq C_{v_i, \varepsilon} \cdot q_{v_i}^{-1/2+\varepsilon} \leq q_{v_i}^{-1/2+\varepsilon}.
\]

This gives a contradiction since \( q_{v_i} \to \infty \).

**Lemma 3.6.** Let \( \iota : G \to \text{GL}_N \) be a faithful representation defined over \( K \) with a unique maximal weight and \( H_i \) be a height function on \( G(A) \) associated to \( \iota \). Then there exist \( m \in \mathbb{N} \setminus \{ 0 \} \) and \( C > 0 \) such that

\[
\xi_G(g) \leq C \cdot H_i^{-1/m}(g) \quad \text{for any } g \in G(A).
\]

**Proof.** Let \( \chi \) denote the highest weight of \( \iota \). Let \( l \in \mathbb{N} \setminus \{ 0 \} \) be such that \( \chi|A^+_v \leq l \cdot \log q_v \eta_v \) for each \( v \in R \). Here \( q_v = e \) if \( v \in R_\infty \). Without loss of generality, we may assume

\[
H_v(\iota(a_v)) = q_v^{\chi(a_v)} \quad \text{for each } a_v \in A^+_v \text{ and } v \in R.
\]

Since \( \eta_v(a_v) = q_v^{\log_q \eta_v(a_v)} \) for \( a_v \in A^+_v \), we have for each \( v \in R \),

\[
\eta_v(a_v)^{-l} \leq \prod_v H_v^{-1}(\iota(a_v)) \quad \text{for } a_v \in A^+_v.
\]

By the continuity of \( H_v \) and the Cartan decomposition \( G(K_v) = U_vA^+_v \Omega_v U_v \), there exists \( r_v \geq 1 \) such that

\[
r_v^{-1} H_v(\iota(a_v)) \leq H_v(\iota(g_v)) \leq r_v H_v(\iota(a_v))
\]

for \( g_v = k_v a_v d_v k_v' \in U_vA^+_v \Omega_v U_v \). Since \( H_i \) is invariant under a compact open subgroup of \( G(A_f) \) and hence \( H_v \) is invariant under \( U_v \) for almost all \( v \in R_f \), we can take \( r_v = 1 \) for almost all \( v \in R_f \).

Therefore if \( g = (g_v) \in G(A) \) with \( g_v = k_v a_v d_v k_v' \in U_vA^+_v \Omega_v U_v \),

\[
\prod_v \eta_v(g_v)^{-l} = \prod_v \eta_v(a_v)^{-l} \leq \prod_v H_v^{-1}(\iota(a_v)) \leq r_v \prod_v H_v^{-1}(\iota(g_v)) \leq r_0 \cdot H_i^{-1}(g)
\]

where \( r_0 = \prod_v r_v < \infty \).

Hence using Lemma 3.3, there exists \( c_1 > 0 \) such that for any \( g = (g_v) \in G(A) \),

\[
\xi_G^i(g) \leq c_1 \cdot \prod_v \eta_v(g_v)^{-l} \leq c_1 \cdot r_0 \cdot H_i^{-1}(g).
\]

This proves the claim. \( \square \)

Theorem 7.1 in [48] shows that for any representation \( \iota \) of \( G \) over \( K \) with a unique maximal weight, the height zeta function

\[
Z(s) := \int_{G(A)} H_i(g)^{-s} d\tau(g)
\]
converges for \( R(s) > a_i \) where \( a_i \) is defined as in (1.3). In particular \( \mathbb{H}^{-1} \) belongs to \( L^p(\mathbb{G}(\mathbb{A})) \) for any \( p > a_i \). Hence as a corollary of [48, Theorem 7.1] using Lemma 3.6, we obtain the following:

**Corollary 3.7.** – There exists \( 0 < p = p(\mathbb{G}) < \infty \) such that \( \xi_{\mathbb{G}} \in L^p(\mathbb{G}(\mathbb{A})) \).

3.2. Restriction of scalars functor

We prove certain functorial properties of \( \xi_{\mathbb{G}} \) for the restriction of scalars functor introduced by Weil [59], which we will need later to reduce the discussion on general almost simple groups to that on absolutely simple \( K \)-groups. We refer to [36, I. 3.1.4] and [8, Ch. 6] for the properties of the restrictions of scalar functor \( R_{K/K} \) used in the following discussion. Suppose that \( k \) is a finite extension field of \( K \) and \( \mathbb{G}' \) is a connected semisimple \( k \)-group. Then \( \mathbb{G} = R_{k/K}(\mathbb{G}') \) is a connected semisimple \( K \)-group.

Denote by \( \{1 = \sigma_1, \ldots, \sigma_d\} \) the set of all distinct embeddings of \( k \) into the algebraic closure of \( K \). Then there is a \( K \)-morphism \( \mu: \mathbb{G} \to G' \) such that the map

\[
\mu^o = (\sigma_1 \mu, \ldots, \sigma_d \mu): \mathbb{G} \to \sigma_1 \mathbb{G}' \times \cdots \times \sigma_d \mathbb{G}'
\]

is a \( K \)-isomorphism. If \( R_{k/K}^o \) denotes the inverse map to \( \mu|_{G(K)} \), then \( R_{k/K}^o: \mathbb{G}'(k) \to \mathbb{G}(K) \) is a group isomorphism.

For each \( v \in R_K \), denote by \( I_v \) the set of all valuations of \( k \) extending \( v \). Then there is a natural \( K_v \)-isomorphism \( f_v: \mathbb{G} \to \prod_{w \in I_v} R_{k_w/K_v} \mathbb{G}' \) and the isomorphisms \( f_v^{-1} \circ R_{k_v/K_v}^o \circ f_v: \prod_{w \in I_v} \mathbb{G}'(k_w) \to \mathbb{G}(K_v), \forall v \in R_K, w \in I_v \), induce a topological group isomorphism, say, \( j \), of the adele group \( \mathbb{G}'(\mathbb{A}_k) \) to \( \mathbb{G}(\mathbb{A}_K) \).

**Lemma 3.9.** – Let \( \varepsilon > 0 \). Then there are constants \( C_\varepsilon \geq 1 \) such that for any \( g \in \mathbb{G}'(\mathbb{A}_k) \),

\[
C^{-1}_\varepsilon \cdot \xi_{\mathbb{G}}(j(g))^{1+\varepsilon} \leq \xi_{\mathbb{G}}(g) \leq C_\varepsilon \cdot \xi_{\mathbb{G}}(j(g))^{1-\varepsilon}.
\]

**Proof.** – Fix \( v \in R_K \). The set \( I_v \) parametrizes the set, say, of all distinct embeddings \( \sigma \) of \( k \) into \( K_v \), which are non-conjugate over \( K_v \), in the way that \( w \in I_v \) corresponds to \( \sigma \) with \( k_w = \sigma(k)K_v \). For each embedding \( w \in I_v \), we denote by \( J_w \) the set of all embeddings \( \tau \) of \( k \) into \( K_v \) such that \( k_w = \tau(k)K_v \). Fix \( w \in I_v \). Let \( A'_w \) be the group of \( k_w \)-points of a maximal \( k_w \)-split torus of \( G' \), \( \Phi(G'(k_w), A'_w) \) the set of non-multiplicative roots, and \( S_w \subset \Phi(G'(k_w), A'_w) \) be a maximal strongly orthogonal system used in the definition of \( \xi_{\mathbb{G}} \). Then \( \prod_{w \in I_v} (R_{k_w/K_v}, A'_w) \) is a maximal \( K_v \)-torus of \( \mathbb{G} \) and its maximal \( K_v \)-split subtorus is a maximal \( K_v \)-split torus of \( \mathbb{G} \) [8, Ch. 6]. For each \( w \in I_v \), let \( B(w) \) denote the group of \( K_v \)-points of the maximal \( K_v \)-split torus of \( R_{k_w/K_v} A' \) and set \( A_v = \prod_{w \in I_v} B(w) \). We can identify each \( B(w) \) with \( \{(\tau a)_{v \in J_w} : a_w \in A'(K_w)\} \), and \( \Psi_w := \Phi((R_{k_w/K_v} G')(K_w), B(w)) \) with \( \{\alpha_w : \alpha \in \Phi(G'(k_w), A'_w)\} \) where \( \alpha_w((\tau a)_{v \in J_w}) = \prod_{v \in J_w} \tau \alpha(a_w) \). Hence \( \{\alpha_w : \alpha \in S_w\} \) is a maximal strongly orthogonal system of \( \Psi_w \).

On the other hand, for any \( \alpha \in S_w \),

\[
|\alpha(a_w)|_w = \left| \prod_{v \in J_w} \tau \alpha(a_w) \right|_w.
\]
Since $\prod_{w \in I_v} S_w$ is a maximal strongly orthogonal system for $\Phi(G(K_v), A_v)$, if $a = (\tau a_w)_{\tau \in J_v} \in A_v$,

$$\eta_{G(K_v)}(a) = \prod_{(\alpha_w)_{w \in I_v} \in \prod_{w \in I_v} S_w} |\alpha_w(\tau a_w)_{\tau \in J_v})|_{v} = \prod_{w \in I_v} \prod_{\alpha_w \in S_w} |\alpha(a_w)|_w = \prod_{w \in I_v} \eta_{G^e(K_v)}(a_w).$$

Hence for all $g \in G^e(\mathbb{A}_k)$,

$$\prod_{v \in R_f} \eta_{G(K_v)}(j(g)) = \prod_{w \in I_v} \eta_{G^e(K_v)}(g).$$

By Lemma 3.3, this proves the claim. \hfill \Box

3.3. Uniform bound for matrix coefficients of $G(\mathbb{A})$

Let $W_f \subset G(\mathbb{A}_f)$ be a compact open subgroup. Write $W_v = W_f \cap G(K_v)$ for each $v \in \mathbb{R}$. Then $W_v = U_v$ for almost all $v \in R_f$. For each $v \in R_f$, by [3], there exists $d_{W_v} < \infty$ such that for any irreducible unitary representation $\rho$ of $G(K_v)$, the dimension of $W_v$-invariant vectors of $\rho$ is at most $d_{W_v}$. Moreover $d_{W_v} = 1$ for almost all $v \in \mathbb{R}$ by [55, 3.3.3] and [25, Corollary 1]. Hence the following number is well-defined:

$$d_{W_f} := \prod_{v \in R_f} d_{W_v} < \infty.$$

The notation $G(K_v)^+$ denotes the normal subgroup of $G(K_v)$ generated by all unipotent subgroups of $G(K_v)$.

**Theorem 3.10.** Let $G$ be a connected absolutely almost simple K-group with K-rank at least 2. Let $W_f$ be a compact open subgroup of $G(\mathbb{A}_f)$. Let $\pi$ be any unitary representation of $G(\mathbb{A})$ without non-trivial $G(K_v)^+$-invariant vector for every $v \in \mathbb{R}$. Then for any $U_{\infty}$-finite and $W_f$-invariant unit vectors $x$ and $y$,

$$|\langle \pi(g)x, y \rangle| \leq d_0 \cdot c_{W_f} \cdot (\dim(U_{\infty, x}) \cdot \dim(U_{\infty, y}))^{(r+1)/2} \cdot \xi_G(g) \quad \text{for all } g \in G(\mathbb{A}),$$

where $c_{W_f} := d_{W_f} \cdot \prod_{v \in R_f} [U_v : U_v \cap W_v] \cdot (\max_{d \in \Omega_v} [U_v : dU_v d^{-1}])$ and $d_0, r \geq 1$ depend only on $G$. Moreover if $G(K_v) \not\cong Sp_{2n}(\mathbb{C})$ locally for any $v \in R_{\infty}$, $d_0 = 1$ and $r = 1$.

If $G$ is a connected almost K-simple adjoint (simply connected) K-group with K-rank at least 2, and $\pi$ has no non-trivial $L(K_v)^+$-invariant vectors for any connected $K_v$-normal subgroup $L$ of $G$, then (3.11) holds with $\xi_G$ replaced by $\xi_G^{1-\varepsilon}$ for any $\varepsilon > 0$.

As a corollary, we obtain the adelic version of Howe-Moore theorem [32] on the vanishing of matrix coefficients:

**Corollary 3.12.** Let $G$ and $\pi$ be as in Theorem 3.10. Then for any vectors $x$ and $y$,

$$\langle \pi(g)x, y \rangle \to 0 \quad \text{as } g \to \infty \text{ in } G(\mathbb{A}).$$

**Proof.** It is easy to see that it suffices to prove the claim for a dense subset of vectors in the Hilbert space $V$ associated to $\pi$. Considering the restriction $\tilde{\pi} := \pi|_U$ to $U$, $V$ decomposes into a direct sum of irreducible unitary representations of the compact group $U$ each of which is finite dimensional by the Peter-Weyl theorem. Hence the set $V_0$ of $U$-finite vectors

4$^e$ SÉRIE – TOME 41 – 2008 – N° 3
is dense in \( V \). Now if \( x, y \in V_0 \), then \( x \) and \( y \) are invariant under a finite index subgroup \( W_f \) of \( U_f \). Hence by applying the above theorem, we obtain that for some constant \( c_0 > 0 \),

\[
|\langle \pi(g)x, y \rangle| \leq c_0 \cdot \xi_G(g) \quad \text{for all } g \in G(\mathbb{A}).
\]

Since \( \xi_G(g) \to 0 \) as \( g \to \infty \), this implies the claim. \( \square \)

The proof of Theorem 3.10 is based on theorems in [40]. More precisely, recall:

**Theorem 3.13 ([40, Theorem 1.1-2]).** Suppose that the \( K_v \)-rank of \( G \) is at least 2. Let \( \pi_v \) be a unitary representation of \( G(K_v) \) without any non-trivial \( G(K_v) \)-invariant vectors. Then for any \( U_v \)-finite unit vectors \( x \) and \( y \),

\[
|\langle \pi(g)x, y \rangle| \leq d_v \cdot c_v \cdot (\dim(U_vx) \cdot \dim(U_vy))^{r_v/2} \cdot \xi_v(g) \quad \text{for any } g \in G(K_v)
\]

where \( c_v = \max_{d \in \Omega_v} [U_v : dU_vd^{-1}] \) and \( d_v, r_v \geq 1 \) depend only on \( G(K_v) \). Moreover whenever \( G(K_v) \neq \text{Sp}_{2n}(\mathbb{C}) \) locally, \( d_v = 1 \) and \( r_v = 1 \).

In the case when \( G(K_v) \cong \text{Sp}_{2n}(\mathbb{C}) \) locally, the above theorem was stated only for \( U_v \)-invariant vectors in [40]. However if we replace Proposition 2.7 in [40] by the remark following it, the same proof works for the above claim.

**Proof of Theorem 3.10.** We first assume that \( G \) is absolutely almost simple. For \( g = (g_v)_v \in G(\mathbb{A}) \), choose a finite subset \( S_g \) of places containing

\[
\{v \in R_f : g_v \notin U_v \} \cup R_\infty.
\]

Note that for \( v \in R - S_g \), we have \( g_v \in U_v \) and hence \( \xi_v(g_v) = 1 \). Therefore for \( g = (g_v)_v \in G(\mathbb{A}) \),

\[
\xi(g) = \prod_{v \in S_g} \xi_v(g_v).
\]

Let \( G_g = \prod_{v \in S_g} G(K_v) \) and \( W_g = \prod_{v \in S_g \cap R_f} W_v \). As a \( G_g \) representation, \( \pi \) has a Hilbert integral decomposition:

\[
\pi = \int_{z \in Z_g} \bigoplus \rho_z \; d\nu(z)
\]

where \( Z_g \) is the unitary dual of \( G_g \) and \( \rho_z \) is irreducible, \( m_z \) is a multiplicity for each \( z \in Z_g \) and \( \nu \) is a measure on \( Z_g \) (see [21] or [61, Section 2.3.2]). We may assume that for all \( z, \rho_z \) has no \( G(K_v) \)-invariant vector (see [61, Prop. 2.3.2]).

If we write \( L_z = \bigoplus m_z \rho_z, x = \int x_zd\nu(z) \) and \( y = \int y_zd\nu(z) \) with

\[
x_z = \sum_{i=1}^{m_z} x_{zi} \quad \text{and} \quad y_z = \sum_{i=1}^{m_z} y_{zi} \in L_z,
\]

we have

\[
\langle x, y \rangle = \int_{Z_g} \sum_{i=1}^{m_z} \langle x_{zi}, y_{zi} \rangle \; d\nu(z).
\]

It follows from the definition of a Hilbert direct integral that

\[
\dim(U_{\infty}x_{zi}) \leq \dim(U_{\infty}x_z) \leq \dim(U_{\infty}x),
\]

Annales Scientifiques de l’École Normale Supérieure
\( x_{zi} \) is \( W_g \)-invariant for almost all \( z \) and all \( i \), and similarly for \( y \). Without loss of generality, we assume the above holds for all \( z \). We claim that
\[
(3.14) \quad \left| (\rho_z(g)x_{zi}, y_{zi}) \right| \leq c_{W_f} \cdot d_0 \cdot \xi_G(g) \cdot (\dim(U_{\infty}x) \cdot \dim(U_{\infty}y))^{(r+1)/2} \cdot \|x_{zi}\| \cdot \|y_{zi}\|
\]
where \( r = \max v_r \) and \( c_0 = d_{W_f} \prod_v (c_v \cdot [U_v : U_v \cap W_v]) < \infty, d_0 = \prod v d_v < \infty \) with \( c_v, d_v, v \) as in Theorem 3.13. By [5], we may write \( \rho_z = \otimes_{v \in S_g} \rho_{z(v)} \) where \( \rho_{z(v)} \) is an irreducible representation of \( G(K_v) \) without no non-trivial \( G(K_v)^+ \)-invariant vectors. Since the finite linear combinations of pure tensor vectors are dense, it suffices to prove (3.14) assuming \( x_{zi} \) and \( y_{zi} \) are finite sums of pure tensors. Hence we can write
\[
x_{zi} = \sum_{v \in S_g} \bigotimes x_{zi(v)} ; \quad y_{zi} = \sum_{k \in S_g} \bigotimes y_{zik(v)}
\]
where for each \( v \in S_g, x_{zi(v)} \) (resp. \( y_{zik(v)} \)) are mutually orthogonal and the number of summands for \( x_{zi} \) (resp. \( y_{zi} \)) is at most \( \dim(U_{\infty}x) \cdot d_{W_f} \) (resp. \( \dim(U_{\infty}y) \cdot d_{W_f} \)). Hence by Cauchy-Schwarz inequality, for \( x_{zi} = \prod_{v \in S_g} x_{zi(v)} \) and \( y_{zi} = \prod_{v \in S_g} y_{zik(v)} \),
\[
\sum_{j} \|x_{zi}\| \leq (\dim(U_{\infty}x) \cdot d_{W_f})^{1/2} \|x_{zi}\| ; \quad \text{and} \quad \sum_{k} \|y_{zik}\| \leq (\dim(U_{\infty}y) \cdot d_{W_f})^{1/2} \|y_{zi}\|.
\]
Since for \( v \in R_f \)
\[
\dim(U_v x) \leq [U_v : W_v \cap U_v] \quad \text{and} \quad \dim(U_v y) \leq [U_v : W_v \cap U_v],
\]
by Theorem 3.13, we have for \( c_0 = \prod v c_v \),
\[
(3.15) \quad \left| (\rho_z(g)x_{zi}, y_{zi}) \right| \leq \sum_{j,k} \prod_{v \in S_g} \left| (\rho_{z(v)}(g_v)x_{zi(v)}, y_{zik(v)}) \right|
\]
\[
(3.16) \quad \leq c_0 \cdot d_0 \cdot \prod_{v \in S_g} \xi_v(g_v) \cdot (\dim(U_{\infty}x))\cdot (\prod_{v \in R_f} [U_v : W_v \cap U_v]) \cdot \left( \sum_{j,k} \|x_{zi}\| \cdot \|y_{zik}\| \right)
\]
\[
(3.17) \quad \leq c_0 \cdot d_0 \cdot \xi_G(g) \cdot (\dim(U_{\infty}x))\cdot (\prod_{v \in R_f} [U_v : W_v \cap U_v]) \cdot d_{W_f} (\|x_{zi}\| \cdot \|y_{zik}\|)
\]
\[
= c_{W_f} \cdot d_0 \cdot \xi_G(g) \cdot (\dim(U_{\infty}x) \cdot \dim(U_{\infty}y))^{(r+1)/2} \cdot (\|x_{zi}\| \cdot \|y_{zik}\|)
\]
proving (3.14). Therefore again by Cauchy-Schwarz inequality,
\[
(3.18) \quad \left| (\oplus^m \rho_z)(g)(x_{zi}, y_{zi}) \right| \leq \sum_i \left| (\rho_z(g)x_{zi}, y_{zi}) \right|
\]
\[
\leq c_{W_f} \cdot d_0 \cdot \xi_G(g) \cdot (\dim(U_{\infty}x) \cdot \dim(U_{\infty}y))^{(r+1)/2} \cdot \|x_{zi}\| \cdot \|y_{zi}\|
\]
By integrating over \( Z_g \), we obtain (3.11).

Since \( G \) is adjoint (resp. simply connected), there exist a finite separable extension \( k \) of \( K \) and a connected adjoint (resp. simply connected) absolutely almost simple \( k \)-group \( G' \) such that \( G = R_K G' \) by [54, 3.1.2]. Then the topological isomorphism \( j^{-1} : G(K) \rightarrow G'(k) \) described prior to Lemma 3.9 maps \( G(K_v) \) and \( G(K_v)^+ \) to...
Let \( \pi \) be a representation on \( G(\mathbb{A}) \) satisfying the hypothesis. Then the representation, say, \( \pi' \), on \( G'(\mathbb{A}_k) \) induced by \( \pi \) has no \( G'(k_w) \)-invariant vectors for each \( w \in R_k \). Since the \( k \)-rank of \( G' \) is equal to the \( K \)-rank of \( G \) and hence is at least 2, by the assertion already proved for \( G'(\mathbb{A}_k) \), we deduce that for any \( U_\infty \)-finite and \( W_f \)-invariant \( x, y \),

\[
|\langle \pi(g)x, y \rangle| = |\langle \pi'(j^{-1}(g))x, y \rangle| \\
\leq d_0 \cdot c_{W_f} \cdot (\dim(U_\infty x) \cdot \dim(U_\infty y))^{(r+1)/2} \cdot \xi_{G'}(j^{-1}(g)) \quad \text{for all } g \in G(\mathbb{A}).
\]

By (3.21), we may replace \( \xi_{G'}(j^{-1}(g)) \) by \( \xi_G(g)^{1-\varepsilon} \), finishing the proof.

### 3.4. Automorphic bound for \( G(\mathbb{A}) \)

If \( G \) has \( K \)-rank at most one, the analogue of Theorem 3.10 does not hold in general. However if we look at those infinite dimensional representations occurring in \( L^2(G(K) \backslash G(\mathbb{A})) \), we still obtain a similar upper bound.

We first state the following conjecture:

**Conjecture 3.19.** Let \( G \) be a connected absolutely almost simple \( K \)-group. Let \( W_f \) be a compact open subgroup of \( G(\mathbb{A}_f) \). Then for any \( U_\infty \times W_f \)-invariant unit vectors \( f, h \in L^2_\infty(G(K) \backslash G(\mathbb{A})) \),

\[
|\langle f, g \cdot h \rangle| \leq c_{W_f} \cdot \xi_G(g) \quad \text{for all } g \in G(\mathbb{A})
\]

where \( c_{W_f} > 0 \) is a constant depending only on \( G \) and \( W_f \).

The above holds for groups of \( K \)-rank at least 2 by Theorem 3.10. For \( G = \text{PGL}_2 \), Conjecture 3.19 is essentially equivalent to the Ramanujan conjecture. We will prove a weaker statement of Conjecture 3.19 where the function \( \xi_G \) is replaced by a function \( \tilde{\xi}_G \) with slower decay such that \( \xi_G \leq \tilde{\xi}_G \leq \xi_G^{1/2} \).

**Definition 3.20.** Let \( G \) be a connected almost \( K \)-simple group. For each \( v \in R \), write \( G \) as an almost direct product \( G_v^1 \cdot G_v^2 \), where \( G_v^1 \) is the maximal semisimple normal \( K_v \)-subgroup of \( G \) such that every simple normal \( K_v \)-subgroup of \( G_v^1 \) has \( K \)-rank one. Note that \( G_v^2 \) is then the maximal semisimple normal \( K_v \)-subgroup of \( G \) without any \( K_v \)-normal subgroup of rank one or more. We define a function \( \tilde{\xi}_G : G(\mathbb{A}) \to (0, 1] \) by

\[
\tilde{\xi}_G := \prod_{v \in R} (\xi_{G_v^1(K_v)}^{1/2} \cdot \xi_{G_v^2(K_v)}).
\]

If \( G \) is absolutely almost simple and \( R_k := \{ v \in R : \text{rank}_{K_v}(G) = 1 \} \), then

\[
\tilde{\xi}_G = \prod_{v \in R_k} \xi_{G_v(K_v)}^{1/2} \cdot \prod_{v \in R - R_k} \xi_{G_v(K_v)}.
\]

If \( G = R_{K/k}G' \) for some finite extension field \( k \) and for a connected absolutely almost simple \( k \)-group \( G' \), then, for any \( w \in R_k \) extending \( v \in R_K \), the \( k_w \)-rank of a connected simple \( k_w \)-subgroup \( H' \) of \( G' \) is equal to the \( K_w \)-rank of the \( K_v \)-subgroup \( R_{k_w/K_v}H' \) of \( G \) (cf. [36, Ch I, 3.1]). Using this, the proof of Lemma 3.9 also shows that there is \( C_\varepsilon > 1 \) such that for any \( g \in G'(\mathbb{A}_k) \)

\[
C_\varepsilon^{-1} \cdot \tilde{\xi}_G(j(g))^{1+\varepsilon} \leq \xi_{G'}(g) \leq C_\varepsilon \cdot \tilde{\xi}_G(j(g))^{1-\varepsilon},
\]

\[3.21\]
where \( j \) denotes the topological group isomorphism from \( G'(\mathbb{A}_k) \) to \( G(\mathbb{A}) \) described prior to Lemma 3.9.

**Theorem 3.22 (Automorphic bounds).** – Let \( G \) be a connected absolutely almost simple \( K \)-group. For a compact open subgroup \( W_f \) of \( G(\mathbb{A}_f) \), there exist \( r = r(G) \geq 1 \) and \( c_{W_f} > 0 \) such that for any \( U_\infty \)-finite and \( W_f \)-invariant unit vectors \( x, y \in L^2_{00}(G(K) \backslash G(\mathbb{A})) \),

\[
||\langle x, g \cdot y \rangle|| \leq c_{W_f} \cdot (\dim(U_\infty x) \cdot \dim(U_\infty y))^{(r+1)/2} \cdot \xi_G(g) \quad \text{for all } g \in G(\mathbb{A}).
\]

One can take \( r = 1 \) provided for any \( v \in R \), \( G(K_v) \) has no subgroup locally isomorphic to \( \text{Sp}_{2n}(\mathbb{C}) \) \((n \geq 2)\) locally.

If \( G \) is a connected almost \( K \)-simple adjoint (simply connected) \( K \)-group, then the above inequality holds with \( \xi_G \) replaced by \( \xi^{1-\varepsilon}_G \) for any \( \varepsilon > 0 \).

Recall that for unitary representations \( \rho_1 \) and \( \rho_2 \) of \( G(K_v) \), \( \rho_1 \) is said to be weakly contained in \( \rho_2 \) if every diagonal matrix coefficient of \( \rho_1 \) can be approximated uniformly on compact subsets by convex combinations of diagonal matrix coefficients of \( \rho_2 \). For each \( v \in R \), denote by \( \tilde{G}_v \), the unitary dual of \( G(K_v) \) and by \( \tilde{G}_v^{\text{Aut}} \subset \tilde{G}_v \), the automorphic dual of \( G(K_v) \) as defined in the introduction. The following theorem was first obtained by Burger and Salam for \( v \) archimean [11, Theorem 1.1] and generalized by Clozel and Ullmo to all \( v \) [17, Theorem 1.4].

**Theorem 3.23.** – Let \( G \) be a connected absolutely almost simple \( K \)-group. Let \( H \subset G \) be a connected semisimple \( K \)-subgroup. Then for any \( v \in R \) and for any \( \rho_v \in \tilde{G}_v^{\text{Aut}} \), any irreducible representation of \( H(K_v) \) weakly contained in \( \rho_v|_{H(K_v)} \), is contained in \( \tilde{H}^{\text{Aut}}_v \).

**Lemma 3.24.** – For any \( v \in R \) such that \( G(K_v) \) is non-compact, \( L^2_{00}(G(K) \backslash G(\mathbb{A})) \) has no non-zero \( G(K_v)^+ \)-invariant function.

**Proof.** – Let \( \mathcal{L}_v \) denote the set of \( f \in L^2_{00}(G(K) \backslash G(\mathbb{A})) \) fixed by \( G(K_v)^+ \). We need to show that \( \mathcal{L}_v = \{0\} \). Let \( G^{(v)} \) denote the subgroup of \( G(\mathbb{A}) \) consisting of elements whose \( v \)-component is trivial. Consider the family of continuous functions \( f \in C_c(G^{(v)}) \) of the form \( f = \prod_{w \in R - \{v\}} f_w \) where each \( f_w \) is a continuous function of \( G(K_w) \) such that \( f_w|_{G^{(v)}} = 1 \) for almost all \( w \). By considering the convolutions with these functions, we obtain a dense family of the continuous functions belonging to \( \mathcal{L}_v \). Hence it suffices to show that any continuous function \( f \in \mathcal{L}_v \) is trivial. Let \( f \in \mathcal{L}_v \) be continuous. Let \( \tilde{G} \) be the simply connected cover of \( G \) and denote by \( \text{pr} : \tilde{G} \to G \) the covering map. Consider the projection map \( G(K) \backslash \tilde{G}(\mathbb{A}) \to G(K) \backslash G(\mathbb{A}) \). Let \( \tilde{f} \) be the pull back of \( f \). Since the image of \( \tilde{G}(K_v) \) under the map \( \text{pr} \) is \( G(K_v)^+ \), the function \( \tilde{f} \) is left \( G(K) \)-invariant and right \( \tilde{G}(K_v) \)-invariant. On the other hand, the strong approximation property implies that \( \tilde{G}(K)G(K_v) \) is dense in \( \tilde{G}(\mathbb{A}) \) (cf. [43, Theorem 7.12]). Therefore \( \tilde{f} \) is constant, and hence \( f \) factors through the image of \( \tilde{G}(\mathbb{A}) \) in \( G(\mathbb{A}) \). Since \( G(\mathbb{A}) / G(\mathbb{A}) \) is abelian, \( L^2(G(K) \backslash \tilde{G}(\mathbb{A})) \backslash G(\mathbb{A})) \) is a sum of automorphic characters of \( G(\mathbb{A}) \). Since \( f \) is orthogonal to \( \Lambda, f = 0. \)

4e SÉRIE – TOME 41 – 2008 – N° 3

A. Gorodnik, F. Maucourant and H. Oh
Proof of Theorem 3.22. – We first treat the case when $G$ is absolutely almost simple. The case when $K$-rank is at least 2 follows from Theorem 3.10 and Lemma 3.24. Suppose first that $G$ has $K$-rank one. By [16, Theorem 3.4], for $v \in R_1$, any infinite dimensional $\rho_v \in G^{\text{Aut}}_v$, and $U_v$-finite vectors $x_v, y_v$.

\begin{equation}
(3.25) \quad |\langle \rho_v(g)(x_v), y_v \rangle| \leq c_v \cdot \xi_v(g)^{1/2} \cdot (\dim(U_v x_v) \cdot \dim(U_v y_v))^{1/2}
\end{equation}

for any $g \in G(K_v)$. Combining this with Theorem 3.13, we can derive the desired bound by the same argument as in the proof of Theorem 3.10.

Now suppose $G$ is $K$-anisotropic. For $v \in R_1$, we claim (3.25) holds. In [15], it is analyzed what kind of $\rho_v$ occurs in this situation, and this is the main case which was not known before Clozel’s work. We give a brief summary. If $R_1 \neq \emptyset$, it follows from the classification theorem by Tits [34] that $G$ is of Dynkin type $A$. [15, Theorem 1.1] says that there exists a $K$-embedding of $K$-subgroup $H$ of type $A$ such that $H$ has $K_v$-rank one whenever $v \in R_1$. Let $v \in R_1$. Then up to isogeny, one has either that $H = \text{PGL}_1(D)$ for a quaternion algebra $D$ over $K$ and $H = \text{PGL}_2(K_v)$ or $H = \text{PGU}(D,*)$ for a division algebra $D$ of prime degree $d$ over a quadratic extension $k$ of $K$ with a second kind involution $*$, and $H = \text{PGU}(n-1,1)$ over $K_v$ (with $n \geq 3$). In the former case one uses the Jacquet-Langlands correspondence [33] to transfer the Gelbart-Jacquet automorphic bound of $\text{PGL}_2$ to $H(K_v)$ via Theorem 3.23. In the second case which is the hardest, by the base changes obtained by Rogawski [44] and Clozel [14], we can use the bound of $\text{PGL}_n(F_w)$ given by Theorem 3.13 to get a bound for $H(K_v)$ where $w$ is a place of $k$ lying above $v$ and $k_v$ is a quadratic extension of $K_v$. This proves the claim. Combining with Theorem 3.13 for those places $v \in R - (R_1 \cup T)$ as in the proof of Theorem 3.10, we obtain the desired bound.

Now for the case when $G$ is adjoint (resp. simply connected) almost $K$-simple, the same argument used in the proof of Theorem 3.10 applies, since (in the notation therein) the topological isomorphism $j : G(A_K) \to G'(A_K)$ induces an equivariant isometry between $L^2_{00}(G(K) \backslash G(A))$ and $L^2_{00}(G'(k) \backslash G'(A_K))$. \hfill $\square$

3.5. From $U_{\infty}$-finite vectors to smooth vectors

In Theorem 3.22, we can relax $U_{\infty}$-finite conditions to smooth conditions provided we replace the $L^2$-norms by $L^2$-Sobolev norms. For a precise formulation, let $X_1, \ldots, X_m$ be an orthonormal basis of the Lie algebra $\text{Lie}(U_{\infty})$ with respect to an $A$-invariant scalar product. Then the elliptic operator

\begin{equation}
D := 1 - \sum_{i=1}^m X_i^2
\end{equation}

lies in the center of the universal enveloping algebra of $\text{Lie}(U_{\infty})$. We say a function $f$ on $G(K) \backslash G(A)$ is smooth if $f$ is invariant under some compact open subgroup of $G(A_f)$ and smooth for the action of $G_{\infty}$.

Theorem 3.27. – Let $G$ be a connected almost absolutely simple $K$-group, and $W_f$ be a compact open subgroup of $G(k_f)$. Then there exist an explicit $l \in \mathbb{N}$ and $c_{W_f} > 0$ such that for any $W_f$-invariant smooth functions $\varphi, \psi \in L^2_{00}(G(K) \backslash G(A))$ with $\|D^l(\varphi)\| < \infty$ and $\|D^l(\psi)\| < \infty$,

\begin{equation}
|\langle \varphi, g \psi \rangle| \leq c_{W_f} \cdot \xi_G(g) \cdot \|D^l(\varphi)\| \cdot \|D^l(\psi)\| \quad \text{for all } g \in G(A).
\end{equation}
If \( G \) is a connected almost \( K \)-simple adjoint (simply connected) \( K \)-group, then the above inequality holds with \( \xi_G \) replaced by \( \xi_G^{1-\varepsilon} \) for any \( \varepsilon > 0 \).

**Proof.** – Deducing this from Theorem 3.22 is quite standard in view of the results of Harish-Chandra explained in [58, Ch. 4]. We give a sketch of the proof. Denote by \( \pi \) the representation \( L_{00}^2(G(K) \backslash G(\mathbb{A})) \). Then \( \pi = \bigoplus_{\nu \in U_{\infty}} \pi_\nu \) where \( \pi_\nu \) is the \( \nu \)-isotypic component of \( \pi \) and \( D \) acts as a scalar, say, \( c_\nu \), on each \( \pi_\nu \). We write \( \varphi = \sum_{\nu \in U_{\infty}} \varphi_\nu \) and
\[
\psi = \sum_{\nu \in U_{\infty}} \psi_\nu.
\]
One has \( \|\varphi_\nu\| = c_\nu^{-1} \|D^l \varphi_\nu\| \) and similarly for \( \psi \). Then
\[
|\langle \varphi, g \cdot \psi \rangle| \leq \sum_{(\nu_1, \nu_2) \in U_{\infty} \times U_{\infty}} |\langle \varphi_{\nu_1}, g \cdot \psi_{\nu_2} \rangle|.
\]
Using Theorem 3.22, we then obtain
\[
|\langle \varphi, g \cdot \psi \rangle| \leq c_{W_I} \cdot \xi_G(g) \left( \sum_{\nu \in U_{\infty}} \|\varphi_\nu\| \dim(U_{\infty} \varphi_\nu)^{(r+1)/2} \right) \left( \sum_{\nu \in U_{\infty}} \|\psi_\nu\| \dim(U_{\infty} \psi_\nu)^{(r+1)/2} \right)
\leq c_{W_I} \cdot \xi_G(g) \cdot \|D^l(\varphi)\| \cdot \|D^l(\psi)\| \cdot \sum_{\nu \in U_{\infty}} c_\nu^{-2l} \dim(\nu)^{r+1}.
\]
Now if \( l \in \mathbb{N} \) is sufficiently large, then \( \sum_{\nu} c_\nu^{-2l} \dim(\nu)^{r+1} < \infty \) [58, Lemma 4.4.2.3]. This proves the claim. \( \Box \)

### 3.6. From \( K \)-simple groups to semisimple groups

If \( G \) is a connected semisimple \( K \)-group, we say that a sequence \( \{g_i \in G(\mathbb{A})\} \) tends to infinity strongly if for any non-trivial connected simple normal \( K \)-subgroup \( H \) of \( G \), \( \rho_H(g_i) \) tends to \( \infty \) as \( i \to \infty \), where \( \rho_H : G(\mathbb{A}) \to G(\mathbb{A})/H(\mathbb{A}) \) denotes the canonical projection.

**Theorem 3.28 (Mixing for \( L^2(G(K) \backslash G(\mathbb{A})) \)).** – Let \( G \) be a product of connected almost \( K \)-simple \( K \)-groups. Then for any \( \varphi, \psi \in L_{00}^2(G(K) \backslash G(\mathbb{A})) \),
\[
|\langle \varphi, g \cdot \psi \rangle| \to 0
\]
as \( g \in G(\mathbb{A}) \) tends to infinity strongly.

**Proof.** – Write \( G = G_1 \times \cdots \times G_m \) where each \( G_i \) is a connected absolutely almost simple \( K \)-group. By Theorem 3.22 and Peter-Weyl theorem (cf. Corollary 3.12), for each \( 1 \leq i \leq m \), and for any \( \varphi_i, \psi_i \in L_{00}^2(G_i(K) \backslash G_i(\mathbb{A})) \),
\[
|\langle \varphi_i, g_i \cdot \psi_i \rangle| \to 0
\]
as \( g_i \to \infty \) in \( G_i(\mathbb{A}) \).

Consider \( \otimes_{i=1}^m L^2(G_i(K) \backslash G_i(\mathbb{A})) \) as a subset of \( L^2(G(K) \backslash G(\mathbb{A})) \). The finite sums of the functions of the form \( \varphi = \otimes_{i=1}^m \psi_i \in L^2(G(K) \backslash G(\mathbb{A})) \), where \( \psi_j \in L^2(G_j(K) \backslash G_j(\mathbb{A})) \) and such that for at least one \( j, \psi_j \in L_{00}^2(G_j(K) \backslash G_j(\mathbb{A})) \), form a dense subset of the space \( L_{00}^2(G(K) \backslash G(\mathbb{A})) \). Hence it suffices to prove the claim for \( \varphi = \otimes_{i=1}^m \varphi_i \) and \( \psi = \otimes_{i=1}^m \psi_i \) of such type. Suppose \( \psi_j \in L_{00}^2(G_j(K) \backslash G_j(\mathbb{A})) \) for some \( 1 \leq j \leq m \). If \( g = (g_1, \ldots, g_m) \) with \( g_i \in G_i(\mathbb{A}) \), then
\[
|\langle \varphi, g \cdot \psi \rangle| = \prod_{i=1}^m |\langle \varphi_i, g_i \cdot \psi_i \rangle| \leq \left( \prod_{i\neq j} \|\varphi_i\| \cdot \|\psi_i\| \right) \cdot \left( \prod_{i=1}^m \|\varphi_i\| \cdot \|\psi_i\| \right).
\]
If \( \varphi_j \) denotes the projection of \( \varphi \) to \( L^2_0(\mathbf{G}_j(K)\backslash\mathbf{G}_j(\mathbb{A})) \), then

\[
\langle \varphi_j, g_j \psi_j \rangle = \langle \varphi_j', g_j \psi_j \rangle.
\]

Since \( g \to \infty \) strongly and hence \( g_j \to \infty \), we obtain \( \langle \varphi_j', g_j \psi_j \rangle \to 0 \) by (3.29). This proves the claim.

By the following proposition, the above theorem applies to connected semisimple adjoint (simply connected) \( K \)-groups.

**Proposition 3.30** ([54, 3.1.2]). – Any connected semisimple adjoint (resp. simply connected) \( K \)-group decomposes into a direct product of adjoint (resp. simply connected) almost \( K \)-simple \( K \)-groups.

### 3.7. Equidistribution of Hecke points

In this subsection which is not needed in the rest of the paper, we explain applications of the adelic mixing in the equidistribution problems of Hecke points considered in [16]. Let \( K = \mathbb{Q} \). Let \( S \) be a finite set of primes including the archimedean prime \( \infty \). If \( \Gamma \) is an \( S \)-arithmetic subgroup of \( \mathbf{G}_S \) (here \( \mathbb{Q}_\infty = \mathbb{R} \) and \( a \in \mathbf{G}(\mathbb{Q}) \)), then the Hecke operator \( T_a \) on \( L^2(\Gamma \backslash \mathbf{G}_S) \) is defined by

\[
T_a(\psi)(g) = \frac{1}{\text{deg}(a)} \sum_{x \in \Gamma \backslash \Gamma_a \Gamma} \psi(xg)
\]

where \( \text{deg}(a) = \# \Gamma \backslash \Gamma a \Gamma \). Theorem 1.11 extends the main result in [16] where some cases of \( \mathbb{Q} \)-anisotropic groups were excluded (see [24]). In fact, the following corollary immediately follows from Theorem 3.22 and Proposition 2.6 in [16]:

**Corollary 3.31.** – Let \( \mathbf{G} \) be a connected simply connected almost \( \mathbb{Q} \)-simple \( \mathbb{Q} \)-group and \( S \) a finite set of primes including \( \infty \). Suppose that \( \mathbf{G}_S \) is non-compact. Let \( \Gamma \subset \mathbf{G}(\mathbb{Q}) \) be an \( S \)-congruence subgroup of \( \mathbf{G}_S \). For any \( \varepsilon > 0 \), there exists a constant \( c = c(\Gamma, \varepsilon) > 0 \) such that

\[
\| T_a \| \leq c \cdot \xi_{\mathbf{G}}^{-1}\varepsilon(a) \quad \text{for any } a \in \mathbf{G}(\mathbb{Q}).
\]

This corollary in particular implies that for any sequence \( a_i \in \mathbf{G}(\mathbb{Q}) \) with \( \text{deg}(a_i) \to \infty \), and for any \( \psi \in C_c(\mathbf{G}_S) \),

\[
\lim_{i \to \infty} \frac{1}{\text{deg}(a_i)} \sum_{x \in \Gamma \backslash \Gamma_a \Gamma} \psi(x) = \frac{1}{\tau_S(\Gamma \backslash \mathbf{G}_S)} \int_{\mathbf{G}_S} \psi(g) \, dr_S.
\]

It is interesting to note that unlike the rational points \( \mathbf{G}(\mathbb{Q}) \) of bounded height (Theorem 1.6), the Hecke points are equidistributed in \( \mathbf{G}_S \) with respect to the invariant measure.

The following corollary presents a stronger version of property \((\tau)\) of \( \mathbf{G} \) proved by Clozel [15]:

**Corollary 3.32.** – Let \( \mathbf{G} \) be a connected simply connected almost \( K \)-simple \( K \)-group. Let \( \pi \) denote the quasi-regular representation of \( \mathbf{G}(\mathbb{A}) \) on \( L^2_0(\mathbf{G}(K)\backslash\mathbf{G}(\mathbb{A})) \). Let \( W \) be a maximal compact subgroup of \( \mathbf{G}(\mathbb{A}) \). Then there exists an explicit \( p = p(\mathbf{G}) < \infty \) such that any \( W \)-finite matrix coefficient of \( \pi \) is \( L^p(\mathbf{G}(\mathbb{A})) \)-integrable.
4. Volume asymptotics and construction of $\tilde{\mu}_t$

4.1. Analytic properties of height zeta functions

Let $G$ be a connected adjoint semisimple algebraic group over $K$. Let $\iota: G \to \mathrm{GL}_N$ be a faithful representation defined over $K$ which has a unique maximal weight. Recall the constants $a_i$ and $b_i$ defined in the introduction (1.3): Choosing a maximal torus $T$ of $G$ defined over $K$ containing a maximal $K$-split torus and a set of simple roots $\Delta$ of the root system $\Phi(G, T)$, denote by $2\rho$ the sum of all positive roots and $\lambda_i$ the unique maximal weight of $\iota$.

If
\[
2\rho = \sum_{\alpha \in \Delta} u_\alpha \alpha \quad \text{and} \quad \lambda_i = \sum_{\alpha \in \Delta} m_\alpha \alpha
\]
then
\[
(4.1) \quad a_i = \max_{\alpha \in \Delta} \frac{u_\alpha + 1}{m_\alpha} \quad \text{and} \quad b_i = \# \left\{ \Gamma_K.\alpha : \frac{u_\alpha + 1}{m_\alpha} = a_i \right\}
\]
where $\Gamma_K$ is the absolute Galois group over $K$.

We fix a height function $H_t = \prod_{v \in R} H_{t,v}$ as defined in (2.6) in the rest of this section. Recall the notation
\[
B_T := \{ g \in G(A) : H_t(g) \leq T \}.
\]

Given an automorphic character $\chi$, we consider the following functions:
\[
Z_S(s, \chi) := \int_{G_S} H_t(g)^{-s} \chi(g) \, d\tau_S(g); \quad Z^S(s, \chi) := \int_{G^S} H_t(g)^{-s} \chi(g) \, d\tau^S(g).
\]

**Lemma 4.2.** There exists $\varepsilon > 0$ such that the following hold for any finite $S \subset R$:

1. $Z_S(s, \chi)$ absolutely converges for $\Re(s) \geq a_i - \varepsilon$.
2. $\tau_S(B_T \cap G_S) = O(T^{a_i - \varepsilon})$ where the implied constant depends on $S$.

**Proof.** For (1), recall the Cartan decomposition for each $v$: $G(K_v) = U_v A_v^+ \Omega_v U_v$ (2.2). Since the definition of $a_i$ does not depend on a particular choice of $T$, we may assume $A_v \subset T(K_v)$. Choose the set of simple roots $\Delta_v = \{ \alpha_1, \ldots, \alpha_r \}$ in the root system $\Phi(G(K_v), A_v)$ so that the restriction of $\Delta$ to $A_v$ is contained in $\Delta_v \cup \{0\}$.

If $2\rho_v$ denotes the sum of all positive roots in $\Phi(G(K_v), A_v)$ and $u'_i$ denotes the sum of all $u_\alpha$’s for those $\alpha$ such that $\alpha | A_v = 1$, i.e., $u'_i = \sum \{ u_\alpha : \alpha | A_v = \alpha_i \}$, then $2\rho_v = \sum_{i=1}^r u'_i \alpha_i$. Similarly, if $\lambda_v := \lambda_i | A_v$, then $m'_i = \sum \{ m_\alpha : \alpha | A_v = \alpha_i \}$, we have $\lambda_v = \sum_{i=1}^r m'_i \alpha_i$.

Observe that
\[
a_v := \max_{1 \leq i \leq r} \frac{u'_i}{m'_i} \leq \max_{\alpha \in \Delta} \frac{u_\alpha}{m_\alpha} < a_i.
\]

Since $\lambda_v$ is the unique maximal weight of $\iota$, we may assume, without loss of generality, that
\[
H_{t,v}(kacd^k) = q_v^{\log v |\lambda_v(a)|}
\]
where $k, k' \in U_v, a \in A_v^+, d \in \Omega_v$ and $q_v = e$ if $v \in R_\infty$.

For $v \in R_\infty$, it is well known (cf. Prop. 5.28 in [34]) that $dg_v = \delta(X) \, dk_1 \, dX \, dk_2$ where for any $\varepsilon > 0$, there exists $C_{\varepsilon} > 0$ such that
\[
\delta(X) < C_{\varepsilon} \exp((1 + \varepsilon)2\rho_v(X)) \quad \text{for all} \quad X \in \log(A_v^+).
\]
Hence if $\sigma > 0$,
\[
\int_{G(K_v)} H_{i,v}(g_v)^{-\sigma} dg_v \leq C_\varepsilon \int_{\log A^+_v} \exp(-\sigma(\lambda_{i,v}(X) + (1 + \varepsilon)2\rho_v(X))) dX \\
\leq C_\varepsilon \prod_{i=1}^r \int_{x_i=0}^\infty \exp(-x_i(\sigma m'_i - u'_i(1 + \varepsilon))) dx_i.
\]
Hence the above converges for any $\sigma > a_v$, proving the claim for $v \in R_\infty$.

Let $v \in R_f$. Without loss of generality, we may assume that $H_{i,v}$ is bi-$U_v$-invariant, and hence
\[
\int_{G(K_v)} H_{i,v}(g_v)^{-\sigma} dg_v = \sum_{ad \in A^+_v \Omega_v} H_{i,v}(ad)^{-\sigma} \tau_v(U_v ad U_v).
\]
By [50, Lemma 4.1.1], there exists $c_1 > 0$ such that $\tau_v(U_v ad U_v) \leq c_1 \cdot q_v^{2\rho_v(a)}$ for all $ad \in A^+_v \Omega_v$. Hence for some constant $c > 0$,
\[
\int_{G(K_v)} H_{i,v}(g_v)^{-\sigma} dg_v \leq c \cdot \sum_{a \in A^+_v} q_v^{-\sigma \lambda_{i,v}(a)+2\rho_v(a)} = c \prod_{i=1}^r \sum_{j=0}^{\infty} q_v^{-(\sigma m'_i-u'_i)j},
\]
where the last term converges for any $\sigma > a_v$. Put
\[
\varepsilon \equiv \frac{1}{2} \left( a_v - \max_{a \in A} \frac{u_a}{m_a} \right)
\]
so that $a_v - \varepsilon > a_v$ for all $v \in R$. The above argument proves the claim (1) for this choice of $\varepsilon$. Also, if $v(t) := \tau_S(\{g \in G_S : H_{i,S}(g) \leq t\})$, and $\sigma > a_v - \varepsilon$,
\[
\int_0^\infty t^{-\sigma} dt(t) = \int_{G_S} H_{i,S}(g)^{-\sigma} d\tau_S(g) < \infty.
\]
Now the second claim follows from the properties of Laplace-Mellin transform (see, for example, [60, Ch. II, § 2]).

One of the main contributions of the paper by Shalika, Takloo-Bighash and Tschinkel [48] is the regularization of $Z^S(s, \chi)$ via the Hecke $L$-functions. Their result stated as [48, Theorem 7.1], together with the results in Tate’s thesis on the meromorphic continuation of Hecke $L$-functions and their boundedness on vertical strips (cf. [10, Prop. 3.16]), implies the following:

**Theorem 4.3.** -- Let $S$ be a finite subset of $R$ and $a_v$, $b_v$ as in (4.1). Then $Z^S(s, \chi)$ converges absolutely when $\Re(s) > a_v$, and there exists $\varepsilon > 0$ such that $Z^S(s, \chi)$ has a meromorphic continuation to $\Re(s) > a_v - \varepsilon$ with a unique pole at $s = a_v$ of order at most $b_v$. The order of the pole is exactly $b_v$ for $\chi = 1$. Moreover, for some constants $\kappa \in \mathbb{R}$ and $C > 0$,
\[
\left| (s-a_v)^{b_v} Z^S(s, \chi) \right| \leq C \cdot (1 + |\Im(s)|)^\kappa
\]
for $\Re(s) > a_v - \varepsilon$. 

**Annales Scientifiques de l’École Normale Supérieure**
In [48], it is assumed that $H_{w,v}$ is smooth for $v \in (R - S) \cap R$, which is stronger than the condition (3) in Definition 2.6. This implies Theorem 4.3 for any $S$ including $R$. On the other hand, by Lemma 4.2, for any finite $S_1 \subset R$, there exists $\varepsilon > 0$ such that the product $Z_{S_1}(s, \chi) = \int_{G_{S_1}} H_s(g)^{-s} \chi(g) \, d\tau S_1(g)$ absolutely converges for all $\Re(s) > a_1 - \varepsilon$. Therefore, for any $S_2 \subset S$, the product $Z_{S_2} = Z_{S-S_2} Z^S$ satisfies the properties listed in Theorem 4.3, provided $Z^S$ does. Therefore Theorem 4.3 holds for any finite $S \subset R$.

We use the following version of Ikehara Tauberian theorem to deduce the volume asymptotics from Theorem 4.3.

**Theorem 4.4.** Fix $a > 0$ and $\delta_0 > 0$. Let $\alpha(t)$ be a non-negative non-decreasing function on $(\delta, \infty)$ such that

$$f(s) := \int_{\delta_0}^{\infty} t^{-s} \, d\alpha$$

converges for $\Re(s) > a$. Suppose that for some $\varepsilon > 0$,

- $f(s)$ has a meromorphic continuation to the half plane $\Re(s) > a - \varepsilon > 0$ and has a unique pole at $s = a$ with order $b$;
- For some $\kappa \in \mathbb{R}$ and $C > 0$,

$$\left| \frac{f(s)(s - a)}{s^b} \right| \leq C \cdot (1 + |\text{Im}(s)|)^\kappa$$

for $\Re(s) > a - \varepsilon$.

Then for some $\delta > 0$,

$$\int_{\delta}^{T} \, d\alpha = \alpha(T) - \alpha(\delta) = \frac{e}{a(b - 1)!} \cdot T^a P(\log T) + O(T^{a-\delta})$$

as $T \to \infty$ where $c = \lim_{s \to a} (s - a)^b f(s)$ and $P(x)$ is a monic polynomial of degree $b - 1$.

**Proof.** This can be proved by repeating the same argument as in the appendix of [12] simply replacing the sum $\sum_{n} n^{-s} \alpha_n$ by the integral $\int_{\delta_0}^{\infty} t^{-s} \, d\alpha(t)$. \qed

### 4.2. Definition of $\gamma_W^S$

Recall from (2.7) that $W_i$ denotes the maximal compact subgroup of $G(\mathcal{A}_f)$ under which $H_i$ is bi-invariant. For any co-finite subgroup $W_f$ of $W_i$, recall from (2.5) the definition $G_{W_f} := \ker(\Lambda^{W_f})$ where $\Lambda^{W_f}$ is the subset of $W_f$-invariant characters in $\Lambda$. We will deduce the asymptotic volume of the intersection $B_T \cap G_{W_f}$, more generally, that of $B_T \cap gG_{W_f} \cap G^S$ for any $g \in G(\mathcal{A})$ and any finite $S \subset R$. In this subsection, we will define a function $\gamma_{W_f}^S : G(\mathcal{A}) \to \mathbb{R}_{>0}$ which appears in the main asymptotic of these volumes.

**Definition 4.5.** For a finite $S \subset R$ and a co-finite subgroup $W_f$ of $W_i$, define a function $\gamma_{W_f}^S : G(\mathcal{A}) \to \mathbb{R}_{>0}$ by

$$\gamma_{W_f}^S(g) := \sum_{\chi \in \Lambda^{W_f}} c_{\chi}^S \cdot \chi(g) \quad \text{with} \quad c_{\chi}^S := \lim_{s \to a_s} (s - a_s)^b Z^S(s, \chi).$$

For simplicity, when $S = \emptyset$, we set $\gamma_{W_f} = \gamma_{W_f}^\emptyset$ and $c_{\chi} = c_{\chi}^\emptyset$. 

4e SÉRIE – TOME 41 – 2008 – N° 3
By Theorem 4.3, the limits appearing in the definition of $\gamma_{W_f}^S$ exist. To show $\gamma_{W_f}^S$ is well-defined, it remains to show the following:

**Proposition 4.6.** – For any $S \subset R$ and any co-finite subgroup $W_f$ of $W$, $\gamma_{W_f}^S(g) > 0$ for any $g \in G(\mathbb{A})$.

We need some preliminaries to prove this proposition.

**Lemma 4.7.** – The following statements hold for any compact open subgroup $W_f$ of $G(\mathbb{A})$:

1. If $G^\circ_\infty$ denotes the identity component of $G_\infty$,
   $$G(K)G^\circ_\infty W_f \subset G_{W_f}.$$

2. $\#\Lambda_{W_f} = [G(\mathbb{A}) : G_{W_f}] < \infty$.

3. For any $g \in G(\mathbb{A})$,
   $$\sum_{\chi \in \Lambda_{W_f}} \chi(g) = \begin{cases} \#\Lambda_{W_f} & \text{if } g \in G_{W_f}, \\ 0 & \text{otherwise}. \end{cases}$$

**Proof.** – Since $G^\circ_\infty$ is a connected semisimple group, $G^\circ_\infty \subset \ker(\chi)$ for any $\chi \in \Lambda$. On the other hand, $\chi(G(K)) = 1$ for any $\chi \in \Lambda$, by the definition of an automorphic character. Hence (1) follows. Since $G^\circ_\infty$ has a finite index in $G_\infty$, it follows from [43, Theorem 5.1] that there exist finitely many $u_1, \ldots, u_h \in G(\mathbb{A})$ such that
   $$G(\mathbb{A}) = \bigcup_{i=1}^h G(K)u_iG^\circ_\infty W_f.$$ It follows by (1) that $[G(\mathbb{A}) : G_{W_f}] < \infty$. Now the quotient $G_{W_f} \setminus G(\mathbb{A})$ is a finite abelian group. In particular, $G_{W_f}$ is an open subgroup of $G(\mathbb{A})$ and hence any character of the group $G_{W_f} \setminus G(\mathbb{A})$ can be considered as a continuous character of $G(\mathbb{A})$ which is trivial on $G_{W_f}$, that is, an element of $\Lambda_{W_f}$. Conversely, any element of $\Lambda_{W_f}$ defines a character of $G_{W_f} \setminus G(\mathbb{A})$.

Now consider the scalar product on the space functions of $G_{W_f} \setminus G(\mathbb{A})$ given by
   $$\langle \psi_1 | \psi_2 \rangle := \frac{1}{[G(\mathbb{A}) : G_{W_f}]} \sum_{x \in G_{W_f} \setminus G(\mathbb{A})} \psi_1(x)\overline{\psi_2(x)}.$$ We claim that $\Lambda_{W_f}$ forms an orthonormal set with respect to this scalar product. For $\chi, \chi' \in \Lambda_{W_f}$, observe that
   $$\sum_{x \in G_{W_f} \setminus G(\mathbb{A})} \chi(x)\overline{\chi'(x)} = \tau(G(K) \setminus G_{W_f})^{-1} \int_{g \in G(K) \setminus G_{W_f}} \left( \sum_{x \in G_{W_f} \setminus G(\mathbb{A})} \chi(gx)\overline{\chi'(gx)} \right) d\tau(g)$$
   $$= \tau(G(K) \setminus G_{W_f})^{-1} \int_{G(K) \setminus G(\mathbb{A})} \chi(x)\overline{\chi'(x)} d\tau(x).$$

**Annales Scientifiques de l’École Normale Supérieure**
Therefore we have

\[ \langle \chi | \chi' \rangle = \frac{1}{|G(\mathbb{A}) : G_{W_f}|} \tau(G(K) \backslash G_{W_f})^{-1} \int_{G(K) \backslash G(\mathbb{A})} \chi(x) \overline{\chi'(x)} \, d\tau(x) \]

\[ = \tau(G(K) \backslash G(\mathbb{A}))^{-1} \langle \chi, \chi' \rangle_{L^2(G(K) \backslash G(\mathbb{A}))} \]

\[ = \langle \chi, \chi' \rangle_{L^2(G(K) \backslash G(\mathbb{A}))} \]

since \( \tau(G(K) \backslash G(\mathbb{A})) = 1 \). Since \( \Lambda \) is an orthonormal subset of \( L^2(G(K) \backslash G(\mathbb{A})) \), the claim follows. Now (2) and (3) follow from the duality of finite groups.

\textbf{Lemma 4.8.} — Fix a finite subset \( S \subset R \). Let \( U \subset G^S \) be an open subset such that \( G^S = FU \) for some finite subset \( F \) of \( G^S \). Then for \( (\sigma \in \mathbb{R}) \)

\[ \lim \inf_{s \to a_i} (s - a_i)^b \int_U H_s(h)^{-\sigma} \, d\tau^S(h) > 0. \]

\textit{Proof.} — By Theorem 4.3,

\[ c_0 := \lim_{s \to a_i} (s - a_i)^b \int_{G^S} H_s(h)^{-\sigma} \, d\tau^S(h) \]

exists and is non-zero. It is then clear that \( c_0 > 0 \) since \( H_s \) is a positive function on \( G^S \). For any \( f \in F \), we can find \( c_f \geq 1 \) such that for all \( h \in G^S \), \( c_f^{-1} H_s(h) \leq H_s(fh) \leq c_f H_s(h) \). Without loss of generality, we may assume \( H_s(h) \geq 1 \) for all \( h \in G^S \). Now for \( \sigma < a_i + 1 \), we have

\[ \int_{G^S} H_s(h)^{-\sigma} \, d\tau^S(h) \leq (\max_{f \in F} c_f)^{a_i + 1} \int_U H_s(h)^{-\sigma} \, d\tau^S(h). \]

Hence the claim follows.

\textbf{Lemma 4.9.} — For any finite \( S \subset R \) and a co-finite subgroup \( W_f \) of \( W_s \), there is a map \( g \mapsto s_g : G^S \to G^S \) which factors through \((G_S \cap G_{W_f}) \backslash G_S \) for which the following hold:

1. \( G_{W_f} = \bigcup_{g \in (G_{W_f} \cap G_S) \backslash G_S} (G_{W_f} \cap G_S)g s_g(G_{W_f} \cap G_S); \)

2. for any \( \varphi \in C_c(G_{W_f}), \)

\[ \int_{G_{W_f}} \varphi \, d\tau_{W_f} = \int_{G_S} \int_{h \in G_S \cap \tau_{W_f}} \varphi(s_g h) \, d\tau^S(h) \, d\tau_s(g) \]

if \( \tau^S \) and \( \tau_s \) are normalized so that \( \tau_{W_f} = \tau^S \times \tau_s \) locally.

\textit{Proof.} — Let \( pr \) denote the restriction of the projection map \( G(\mathbb{A}) \to G_S \) to \( G_{W_f} \). Since \( G(K) \) is dense in \( G_S \) by the weak approximation and the image \( pr(G_{W_f}) \) is an open subgroup containing \( G(K) \), the map \( pr \) is surjective.

Note that \((G_{W_f} \cap G^S)(G_{W_f} \cap G_S) \) is a normal subgroup of \( G_{W_f} \), and that the map \( pr \) induces an isomorphism, say \( \tilde{pr} \), between \((G_{W_f} \cap G_S)(G_{W_f} \cap \tilde{G}_S) \backslash G_{W_f} \) and \((G_{W_f} \cap G_S) \backslash G_S \).

For each \( g \in (G_{W_f} \cap G_S) \backslash G_S \), choose \( s_g \in G^S \cap \tilde{pr}^{-1}(g) \). This yields the decomposition

\[ G_{W_f} = \bigcup_{g \in (G_{W_f} \cap G_S) \backslash G_S} (G_{W_f} \cap G_S)g s_g(G_{W_f} \cap G_S) s_g. \]

Since \((G_{W_f} \cap G_S)s_g g = g s_g(G_{W_f} \cap G_S)\), (1) follows. It is easy to deduce (2) from (1).
Proof of Proposition 4.6: For \( g \in G^S \), consider
\[
\sum_{\chi \in \Lambda^W} \mathcal{Z}^S(s, \chi) \chi(g) = \sum_{\chi \in \Lambda^W} \int_{G^S} H_s(h)^{-s} \chi(gh) d\tau^S(h)
= (\#\Lambda^W) \int_{g^{-1}G W_f \cap G^S} H_s(h)^{-s} d\tau^S(h)
\]
where the second equality holds by Lemma 4.7(3).

Hence
\[
(\#\Lambda^W)^{-1} \cdot \gamma^S_{W_f}(g) = \lim_{s \to a_i} (s - a_i)^b \int_{g^{-1}G W_f \cap G^S} H_s(h)^{-s} d\tau^S(h),
\]
which is equal to, along \( \sigma \in \mathbb{R} \),
\[
\lim_{s \to a_i} (s - a_i)^b \int_{g^{-1}G W_f \cap G^S} H_s(h)^{-\sigma} d\tau^S(h).
\]

Therefore by Lemma 4.8, \( \gamma^S_{W_f}(g) > 0 \) for \( g \in G^S \). Since \( G(H) = G_S^S G^S \), it suffices to prove \( \gamma^S_{W_f}(hx) > 0 \) for any \( h \in G_S \) and \( x \in G^S \). Let \( s_h \in G^S \) be as defined in Lemma 4.9. By (1) of the same lemma,
\[
\chi(h) = \chi(s_h^{-1})
\]
for any \( \chi \in \Lambda^W_f \). This implies that for any \( x \in G^S \), \( \gamma^S_{W_f}(hx) = \gamma^S_{W_f}(s_h^{-1}x) \). Since \( s_h^{-1}x \in G^S \), by Theorem 4.13, \( \gamma^S_{W_f}(s_h^{-1}x) > 0 \) and hence \( \gamma^S_{W_f}(hx) > 0 \). This finishes the proof.

The functions \( \gamma^S_{W_f} \) are related for different \( S \)'s by the following:

**Proposition 4.11.** – Let \( S \subset S' \) be finite subsets of \( R \) and let \( W_f \) be a co-finite subgroup of \( W_f \).

1. For any \( g \in G^S \),
\[
\gamma^S_{W_f}(g) = \int_{h \in G_{\sigma_0}} H^{-a_i}_{\sigma_0}(h) \gamma^S_{W_f}(hg) d\tau_{\sigma_0}, \quad \text{for } S_0 = S' - S.
\]

2. In particular, for any finite \( S \subset R \),
\[
\gamma_{W_f}(e) = \int_{G^S} H^{-a_i}_{G^S} \gamma^S_{W_f} d\tau_S.
\]

3. \( \gamma_{W_f} = \sum_{\chi \in \Lambda} c^\chi \chi \) in particular, \( \gamma_{W_f} = \gamma_{W_f} \).

**Proof.** – Note that \( G^S = G_{\sigma_0} G_{S'} \) and \( \tau^S = \tau_{\sigma_0} \times \tau_{S'} \). Since \( \int_{G_{\sigma_0}} H^{-a_i}_{\sigma_0} \chi d\tau_{\sigma_0} \) exists for any \( \chi \in \Lambda \) by Lemma 4.2, we deduce
\[
\gamma^S_{W_f}(g) = \sum_{\chi \in \Lambda^W_f} \left( \int_{G_{\sigma_0}} H^{-a_i}_{\sigma_0} \chi d\tau_{\sigma_0} \right) \cdot \left( \lim_{s \to a_i} (s - a_i)^b \mathcal{Z}^S(s, \chi) \right) \cdot \chi(g)
= \int_{h \in G_{\sigma_0}} H_{\sigma_0}(h)^{-a_i} \sum_{\chi \in \Lambda^W_f} c^\chi_{S'} \chi(gh) d\tau_{\sigma_0}(h)
= \int_{h \in G_{\sigma_0}} H_{\sigma_0}(h)^{-a_i} \gamma^S_{W_f}(gh) d\tau_{\sigma_0}(h).
\]

Hence (1) follows. By putting \( S = \emptyset \), (2) follows.
Since \( H_i \) is \( W_f \)-invariant, it follows from Lemma 4.12 below \( c_\chi = 0 \) for any \( \chi \in \Lambda - \Lambda^{W_f} \). Hence the claim holds.

**Lemma 4.12.** Let \( Y = G(K) \) or \( G(K) \setminus G(K) \). Let \( W_f \) be a co-finite subgroup of \( W_i \) and let \( \chi \in \Lambda - \Lambda^{W_f} \). Then for any \( W_f \)-invariant function \( \psi \) on \( Y \), we have

\[
\int_Y \chi(g) \psi(g) \, d\tau(g) = 0,
\]

if the integral exists. In particular, if the support of \( \psi \) is contained in \( G(K) \setminus G_{W_f} \) and \( \int_{G(K) \setminus G_{W_f}} \psi \, d\tau = 0 \), then for any \( \chi \in \Lambda \),

\[
\int_{G(K) \setminus G_{W_f}} \chi \cdot \psi \, d\tau = 0.
\]

**Proof.** Since \( \chi \in \Lambda - \Lambda^{W_f} \) there exists \( w \in W_f \) such that \( \chi(w) \neq 1 \). Since \( \psi \) is \( W_f \)-invariant and \( \tau \) is invariant,

\[
\int_{G(\mathbb{A})} \chi(g) \psi(g) \, d\tau_0(g) = \int_{G(\mathbb{A})} \chi(wg) \psi(wg) \, d\tau(g) = \chi(w) \int_{G(\mathbb{A})} \chi(g) \psi(g) \, d\tau(g).
\]

This equality implies the first claim immediately. For the second claim, it suffices to note that for \( \chi \in \Lambda^{W_f} \), \( \chi = 1 \) on \( G_{W_f} \).

**4.3. Volume asymptotic**

**Theorem 4.13.** Let \( a_i \in \mathbb{Q}^+ \) and \( b_i \in \mathbb{N} \) be as in (4.1). Then for any finite subset \( S \subset R \), any co-finite subgroup \( W_f \) of \( W_i \) and \( g \in G^S \), there exist a monic polynomial \( P(x) \) of degree \( b_i - 1 \) and a positive real number \( \delta \) such that

\[
\tau^S(B_T \cap gGW_f \cap G^S) = \frac{\gamma_{W_f}(g^{-1})}{\#\Lambda^{W_f} \cdot \alpha_i(b_i - 1)!} \cdot T^{a_i} \cdot P(\log T) + O(T^{a_i - \delta}).
\]

In particular, as \( T \to \infty \),

\[
\tau^S(B_T \cap gGW_f \cap G^S) = \frac{\gamma_{W_f}(g^{-1})}{\#\Lambda^{W_f} \cdot \alpha_i(b_i - 1)!} \cdot T^{a_i} \cdot (\log T)^{b_i - 1}.
\]

**Proof.** By Lemma 2.5, \( B_T \) is a relatively compact subset of \( G(\mathbb{A}) \) and hence \( \tau^S(B_T \cap G^S) < \infty \) for each \( T \geq 1 \) and for any finite \( S \). By the same lemma, \( \delta_0 := \inf_{g \in G(\mathbb{A})} H_i(g) > 0 \). Define

\[
\alpha(t) = \tau^S(B_t \cap gGW_f \cap G^S) \quad \text{for } t \in [\delta_0, \infty),
\]

and

\[
f(s) = \int_{\delta_0}^{\infty} t^{-s} \, d\alpha.
\]

Then by (4.10),

\[
f(s) = \int_{gGW_f \cap G^S} H_i(h)^{-s} \, d\tau^S(h) = (\#\Lambda^{W_f})^{-1} \sum_{\chi \in \Lambda^{W_f}} Z^S(s, \chi) \chi(g^{-1}).
\]

Since

\[
\lim_{s \to a_i} (s - a_i)^{b_i} f(s) = (\#\Lambda^{W_f})^{-1} \gamma_{W_f}(g) > 0
\]
by Proposition 4.6, the claim follows from Theorems 4.3 and 4.4.

Lastly in this subsection, we show that the volume asymptotic for \( \tau_{W_f}(B_T \cap G_{W_f}) \) is independent of \( W_f \)'s.

**Corollary 4.16.** – For \( g \in G(\mathbb{A}) \) and any co-finite subgroup \( W_f \) of \( W_\mathbb{A} \),

\[
\tau(B_T \cap gG_{W_f}) \sim_T [G_{W_f} : G_{W_f}] \cdot \tau(B_T \cap gG_{W_f}).
\]

In particular,

\[
\lim_{T \to \infty} \frac{\tau_{W_f}(B_T \cap G_{W_f})}{\tau_{W_f}(B_T \cap G_{W_f})} = 1.
\]

**Proof.** – Since \( \gamma_{W_f}(g) = \gamma_{W_f}(g) \) by Proposition 4.11, the first claim follows from Theorem 4.13 and Lemma 4.7(2). Since the restriction of \( \tau \) to \( G_{W_f} \) is equal to \([G(\mathbb{A}) : G_{W_f}] \cdot \gamma_{W_f}\), the second claim follows from the first one. \(\Box\)

### 4.4. Construction of \( \bar{\mu}_i \)

Let \( \bar{\iota} : G \to \mathbb{P}(M_N) \) denote the projective embedding obtained by the composition of \( \iota \) with the canonical projection from \( GL_N \to \mathbb{P}(M_N) \). For each \( v \in R \), denote by \( X_{i,v} \) the closure of \( \bar{\iota}(G(K_v)) \) in \( \mathbb{P}(M_N(K_v)) \), and set

\[
X_i = \prod_{v \in R} X_{i,v}.
\]

Fix a height function \( H_i = \prod_{v \in R} H_{i,v} \) on the associated adele group \( G(\mathbb{A}) \) relative to \( \iota \) as in Definition 2.6. For a finite subset \( S \subset R \), set \( H_{i,S} = \prod_{v \in S} H_{i,v} \) and \( X_{i,S} = \prod_{v \in S} X_{i,v} \).

Without loss of generality, we may consider \( G(K_v) \) as a subset of \( X_{i,v} \). We will first construct a family of measures \( \{\mu_{i,W_f,S}\} \) on \( X_i,S \) for all finite \( S \) and for all co-finite subgroups \( W_f \) of \( W_\mathbb{A} \), and put them together to define the measure \( \bar{\mu}_i \) on \( X_i \).

Recall the definition of the function \( \gamma^S_{W_f} \) on \( G(\mathbb{A}) \) from (4.5), and the notation \( \gamma_{W_f}(e) = \gamma^S_{W_f}(e) \). By Lemma 4.2 and Propositions 4.6, 4.11 (2), the following is a well-defined probability measure on \( G_S \) (which will be in fact considered as a measure on \( X_{i,S} \)):

\[
d\mu_{i,W_f,S}(g) := \gamma_{W_f}(e)^{-1} \cdot H_{i,S}(g)^{-a_i} \cdot \gamma^S_{W_f}(g) d\tau_S(g).
\]

**Remark 4.17.** – Let \( G'_S \) denote the derived subgroup of \( G_S \). Then \( |G_S : G'_S| < \infty \) [43, Proposition 3.17]. Then for any \( \psi \in C(X_i,S) \), since the projection of \( \gamma^S_{W_f} \) to \( G_S \) factors through \( G'_S \), we deduce that

\[
\mu_{i,W_f,S}(\psi) = \gamma_{W_f}(e)^{-1} \sum_{u \in G_S/G'_S} \gamma^S_{W_f}(u) \cdot \int_{uG'_S} H_{i,S}(g)^{-a_i} \psi(g) d\tau_S(g).
\]

Since \( \gamma^S_{W_f}(u) > 0 \) for each \( u \), it follows that the measure \( \mu_{i,W_f,S} \) is equivalent to a Haar measure on \( G_S \), considered as a measure on \( X_{i,S} \).

For \( W_f < W_\mathbb{A} \), denote by \( C(X_i)^{W_f} \) the closed subspace of \( C(X_i) \) consisting of functions which are (right)-invariant under \( W_f \).
Theorem 4.18. – There exists a unique probability measure $\tilde{\mu}_i$ on $X_i$ such that for any $\psi \in \bigcup_{W_f < W_i} \text{co-finite} \ C(X_i)^{W_f}$,

$$
(4.19) \quad \tilde{\mu}_i(\psi) = \gamma_{W_i}(e)^{-1} \sum_{\chi \in \Lambda} \lim_{s \to a_i^{-}} (s - a_i)^{b_i} \int_{G(\Lambda)} H_s(g)^{-s} \chi(g) \psi(g)d\tau(g).
$$

Proof. – Define a linear functional $\mu_{i,W_f}$ on $C(X_i)^{W_f}$ by

$$
(4.20) \quad \mu_{i,W_f}(\psi) = \gamma_{W_i}(e)^{-1} \sum_{\chi \in \Lambda} \lim_{s \to a_i^{-}} (s - a_i)^{b_i} \int_{G(\Lambda)} H_s(g)^{-s} \chi(g) \psi(g)d\tau(g).
$$

We first claim that $\mu_{i,W_f}$ is well-defined, positive and bounded by 1 and $\mu_{i,W_f}(1) = 1$. For each finite set of places $S$, let $C(W_f, S)$ denote the subset of $C(X_i)^{W_f}$ consisting of functions which factor through $X_i,S$. The restriction of $\psi \in C(W_f, S)$ to $X_i,S$ will also be denoted by $\psi$ by abuse of notation. By Proposition 4.11 (1), the measures $\mu_{i,W_f,S}$ are compatible in the sense that for $S \subset S'$, the restriction of $\mu_{i,W_f,S'}$ to $C(W_f, S)$ coincides with $\mu_{i,W_f,S}$. Observe that for $\psi \in C(W_f, S)$,

$$
(4.21) \quad \mu_{i,W_f}(\psi) = \mu_{i,W_f,S}(\psi).
$$

Hence the limit exists in (4.20) for all $\psi \in C(W_f, S)$ for each finite $S$. Since $\bigcup_{S} C(W_f, S)$ is dense in $C(X_i)^{W_f}$ where $S$ ranges over all finite subsets of $R$ and $\mu_{i,W_f}$ is a linear functional with

$$
|\mu_{i,W_f}(\psi)| \leq \|\psi\|_{\infty} \quad \text{for any } \psi \in C(X_i)^{W_f}
$$

it follows that the limit exists in (4.20) for any $\psi \in C_c(X_i)^{W_f}$ and hence $\mu_{i,W_f}$ is well-defined. The other claims on $\mu_{i,W_f}$ are now clear.

By applying Lemma 4.12 for $\psi = H_i^{-s}$, the family $\mu_{i,W_f}$ of linear functionals on $C(X_i)^{W_f}$ is compatible, in the sense that if $V_f \subset W_f$ are co-finite subgroups of $W_i$, then

$$
\mu_{i,V_f}|_{C(X_i)^{W_f}} = \mu_{i,W_f}.
$$

Hence (4.19) is well-defined on $C_0 := \bigcup_{W_f < W_i} \text{co-finite} \ C(X_i)^{W_f}$.

Since $C_0$ is dense in $C(X_i)$, there exists a unique positive linear functional $\tilde{\mu}_i$ on $C(X_i)$ satisfying (4.19).

Proposition 4.22. – For any finite $S \subset R$, the projection $\tilde{\mu}_{i,S}$ of $\tilde{\mu}_i$ on $X_i,S$ is equivalent to a Haar measure of $G_S$.

Proof. – Recall that $G_S'$ denotes the derived subgroup of $G_S$. We first claim that if $V_f, W_f$ are co-finite subgroups of $(W_i \cap G_S') \times (W_i \cap G^S)$, then $\mu_{i,W_f,S} = \mu_{i,V_f,S}$. Indeed, by definition of $\mu_{i,W_f,S}$ and $\gamma^S_{W_f}$, it is sufficient to show that for all $\chi \notin \Lambda^{W_f}, c^S_{\chi} = 0$, and so by symmetry:

$$
\gamma^S_{V_f}(g) = \sum_{\chi \in \Lambda^{V_f} \cap \Lambda^{W_f}} c^S_{\chi} \cdot \chi(g) = \gamma^S_{W_f}(g).
$$

Let $\chi \notin \Lambda^{W_f}$, so that $\chi(w) \neq 1$ for some $w \in W_f$. Write $w = w_S w^S$, where $w_S \in G_S$ and $w^S \in G^S$. Then $\chi(w^S) = \chi(w) \neq 1$ since $w_S \in G_S$, and hence

$$
c^S_{\chi} = \lim_{s \to a_i} (s - a_i)^{b_i} \int_{G^S} H_s(g)^{-s} \chi(g)d\tau^S(g).
$$
Since \( W_f \subset W_i \), and \( w^S \in W_i 
abla \),
\[
\int_{G^S} H_i(g)^{-s} \chi(g) d\tau^S(g) = \int_{G^S} H_i(gw^S)^{-s} \chi(gw^S) d\tau^S(g) 
\]
\[
= \chi(w^S) \int_{G^S} H_i(g)^{-s} \chi(g) d\tau^S(g), 
\]
which proves that this integral is zero for all \( s \), and so \( c_{s, \chi} = 0 \).

Define \( \tilde{\mu}_{i,S} = \mu_{i,W_f,S} \) for any \( W_f \subset (W_i \cap G^\mathfrak{s}_i) \times (W_i \cap G^S) \). This measure is absolutely continuous, by the remark 4.17 on \( \mu_{i,W_f,S} \). We claim that \( \tilde{\mu}_{i,S} \) is precisely the projection of \( \tilde{\mu}_i \). For \( \psi \in C(W_f, S) \) for some \( W_f < (W_i \cap G^\mathfrak{s}_i) \times (W_i \cap G^S) \), we have
\[
\tilde{\mu}_i(\psi) = \mu_{i,W_f}(\psi) = \mu_{i,W_f,S}(\psi) = \tilde{\mu}_{i,S}(\psi).
\]
Since the union \( \bigcup_{W_f} C(W_f, S) \), where \( W_f \) ranges over co-finite subgroups of \( G(\mathfrak{h}_f) \) contained in \((W_i \cap G^\mathfrak{s}_i)(W_i \cap G^S)\), is dense in \( C(X_i, S) \), this finishes the proof. \( \square \)

Let \( \iota : G \to GL_N \) be an absolutely irreducible representation defined over \( K \) with the highest weight \( \lambda_i \). Set
\[
\Delta_i = \left\{ \alpha \in \Delta : \frac{u_\alpha + 1}{m_\alpha} = a_i \right\}.
\]
For \( \alpha \in \Delta_i \), we denote by \( \check{\alpha} \) the corresponding coroot. It follows from Theorem 7.1 in [48] that if for a finite subset \( S \subset R \) and an automorphic character \( \chi \),
\[
e_s^S = \lim_{s \to a_i^+} (s - a_i)^{b_\chi} \int_{G^S} H_i(g)^{-s} \chi(g) \, dg \neq 0,
\]
then\(^{(4.23)} \)
\[
\chi(\check{\alpha}) = 1 \text{ for all } \alpha \in \Delta_i,
\]
and conversely if \((4.23)\) holds, then \( c_{s, \chi} \neq 0 \) for all sufficiently large \( S \subset R \).

**Remark 4.24.** – We discuss some examples to illuminate the properties of the measure \( \tilde{\mu}_i \).

1. Suppose that \( \lambda_i \) is a multiple of \( 2\rho + \sum_{\alpha \in \Delta} \alpha \). In particular, this holds for \( \lambda_i \) corresponding to the anticanonical class and for all rank 1 groups.

   Then \( \Delta_i = \Delta \). If a character \( \chi \in \Lambda \) satisfies \((4.23)\) then it follows from the Cartan decomposition \((2.1)\) that \( \chi(G^S) = 1 \) for sufficiently large \( S \) and by the weak approximation, \( \chi = 1 \). This shows that \( c_{s, \chi}^S \neq 0 \) for every finite \( S \subset R \) and every \( \chi \in \Lambda^{W_f - \{1\}} \), so \( \gamma_{W_f}^S \) is equal to \( \lim_{s \to a_i} (s - a_i)^{b_\chi} Z^S(s, 1) \). Hence by Theorem 4.13,
\[
\# G(K) \cap B_T \sim_T \tau(B_T); 
\]

and
\[
(4.25) \quad \tilde{\mu}_i = \prod_{v \in R} \frac{H_{i,v}(g_v)^{-a_i} \, d\tau_v(g_v)}{\int_{G(K_v)} H_{i,v}(g_v)^{-a_i} \, d\tau_v(g_v)}.
\]

\( \square \)
2. Suppose that $K$ has class number one, $G$ is $K$-split and $W_v = \prod_{v \in R_f} G(\mathcal{O}_v)$ (with respect to the canonical model over the ring $\mathcal{O}$ of integers).

According to Remark in Section 2 in [27],

$$G(\mathcal{A}) = G(K)G_\infty^W W_v.$$ 

Hence, $\Lambda^{W_v} = \{1\}$, and consequently, (4.25) holds and $\mu_\ast_W$ is given by (4.26).

3. (Cf. Example 8.10, [48].) Let $G = \text{PGL}_4$ and $\iota$ be the adjoint representation. By [43, §8.2], there exists a lattice $L \subset \text{pgl}_4(K)$ (i.e., an $\mathcal{O}$-module of full rank) such that $G$ has class number 2 with respect to $L$. We take the height function $H = \prod_{v \in R_f} H_v$ where $H_v$ is the maximum norm with respect to $L$ for $v \in R_f$. The group $W_v$ is given by $\prod_{v \in R_f} \text{Stab}_G(\mathcal{O}_v)(L \otimes \mathcal{O}_v)$. By [43, §8.2], $G(K)G_\infty W_v$ is a normal subgroup of index 2 in $G(\mathcal{A})$. If we additionally assume that the number field $K$ is totally complex, then $G_\infty$ is connected and, hence, $\Lambda^{W_v} = \{1, \chi\}$ for some automorphic character $\chi$ of order 2.

Every automorphic character of $G(\mathcal{A})$ is of the form $\eta \circ \text{det}$ where $\eta$ is a Hecke character such that $\eta^q = 1$. Since the map $\text{det}: \text{PGL}_4(K_v) \to K_v^\times / (K_v^\times)^4$ is surjective for every $v \in R$, it follows that $\chi = \eta \circ \text{det}$ with $\eta^2 = 1$. In this case, the roots and coroots are given by

$$\alpha_i(\text{diag}(a_1, \ldots, a_4)) = a_i a_{i+1}^{-1}, \quad \alpha_i(t) = \text{diag}(\underbrace{t, \ldots, t}_i, 1, \ldots, 1)$$

for $i = 1, 2, 3$, and

$$\lambda_i = \alpha_1 + \alpha_2 + \alpha_3, \quad 2\rho = 3\alpha_1 + 4\alpha_2 + 3\alpha_3.$$ 

Hence, $a_i = 5$, $b_i = 1$, $\Delta_i = \{\alpha_2\}$. Then (4.23) is equivalent to $\eta^2 = 1$, and we deduce that $c_\chi^S \neq 0$ for sufficiently large finite $S \subset R$. Since the function $\gamma^S = c_\chi^S + c_\chi^S \chi$ restricted to $G_S$ is not constant for sufficiently large $S \subset R$, we conclude that

$$\mu_\ast_W, S \neq \prod_{v \in S} \frac{H_v(g_v)^{-a_i} d\tau_v(g_v)}{\int_{G(K_v)} H_v(g_v)^{-a_i} d\tau_v(g_v)}.$$ 

We also note that in this case, Theorem 4.13 implies that for an automorphic character $\chi$ such that $c_\chi \neq 0$, we have

$$\lim_{T \to \infty} \frac{\tau(B_T \cap G_{W_f})}{\tau(B_T)} = c_{\chi}^{-1} \frac{1}{2} \left(c_1 + c_\chi\right) \neq \frac{1}{2}.$$ 

In particular, it may happen that in Theorem 1.10, $\tau(B_T)$ is not asymptotic to $[G(\mathcal{A}) : G_{W_f}] \cdot \tau(B_T)$ as $T \to \infty$.

4.5. Equidistribution of height balls $B_T \cap G_{W_f}$ with respect to $\tilde{\mu}_\ast$.

**Proposition 4.27.** — Let $W_f < W_\ast$ be a co-finite subgroup. Then for any $\psi \in C(X_\lambda)^{W_f}$,

$$\lim_{T \to \infty} \frac{1}{\tau_{W_f}(B_T \cap G_{W_f})} \int_{B_T \cap G_{W_f}} \psi d\tau_{W_f} = \tilde{\mu}_\ast(\psi).$$ 

4e SÉRIE – TOME 41 – 2008 – N° 3
Proof. – To prove the proposition, we may assume \( \psi \in C(W_T, S) \) for some finite \( S \), since these functions form a dense subset of \( C(X)_{W_T} \). Let \( \chi_{B_T} \) denote the characteristic function of the set \( B_T \). By Lemma 4.9 (2), we have a map \( g \in G_S \mapsto s_g \in G^S \) such that

\[
\int_{B_T \cap G_{W_T}} \psi \, d\tau_{W_T} = \int_{g \in G_S} \psi(g) \int_{h \in G^S \cap G_{W_T}} \chi_{B_T}(g s_g h) \, d\tau^S(h) \, ds(g).
\]

Since \( H_i(g s_g h) = H_{i,S}(g) H_i(s_g h) \),

\[
\int_{h \in G^S \cap G_{W_T}} \chi_{B_T}(g s_g h) \, d\tau^S(h) = \tau^S(h) \{ h \in G^S \cap G_{W_T} : H_i(s_g h) < T H_{i,S}(g)^{-1} \}
\]

\[
= \tau^S(s_g^{-1} B_{T,H_i,S}(g)^{-1} \cap G_{W_T} \cap G^S)
\]

\[
= \tau^S(B_{T,H_i,S}(g)^{-1} \cap s_g G_{W_T} \cap G^S).
\]

Hence

\[
(4.28) \quad \int_{B_T \cap G_{W_T}} \psi \, d\tau_{W_T} = \int_{g \in G_S} \psi(g) \tau^S(B_{T,H_i,S}(g)^{-1} \cap s_g G_{W_T} \cap G^S) \, d\tau_S(g).
\]

Setting

\[
y_T(g) := \frac{\tau^S(B_{T,H_i,S}(g)^{-1} \cap s_g G_{W_T} \cap G^S)}{\tau^S(B_{T} \cap G_{W_T} \cap G^S)},
\]

we claim that for some constant \( C > 0 \),

\[
(4.29) \quad y_T(g) \leq C \cdot H_{i,S}(g)^{-a_i} \quad \text{for any } g \in G_S.
\]

By (4.15), for any \( h \in G^S \), there exists a constant \( c_h \geq 1 \) such that for any \( T > 2 \),

\[
(4.30) \quad c_h^{-1} \cdot T^{a_i \cdot (\log T)^{b_i - 1}} \leq \tau^S(B_T \cap h G_{W_T} \cap G^S) \leq c_h \cdot T^{a_i \cdot (\log T)^{b_i - 1}}.
\]

Since \( \{ s_g \in G^S : g \in G_S \} \) is a finite set, \( c := \max\{c_{s_g} : g \in G_S\} < \infty \). It follows by (4.30) that for any \( g \in G_S \) with \( H_{i,S}(g) \leq T/2 \),

\[
\tau^S(B_{T,H_i,S}(g)^{-1} \cap s_g G_{W_T} \cap G^S) \leq c \cdot H_{i,S}(g)^{-a_i} \cdot T^{a_i \cdot (\log T H_{i,S}(g)^{-1})^{b_i - 1}}.
\]

On the other hand for any \( g \in G_S \) satisfying \( T/2 \leq H_{i,S}(g) \leq T \delta_0^{-1} \) where \( \delta_0 := \inf_{g \in G(\mathbb{A})} H_i(g) > 0 \) (see Lemma 2.5),

\[
\tau^S(B_{T,H_i,S}(g)^{-1} \cap s_g G_{W_T} \cap G^S) \leq \tau^S(B_2 \cap G^S) \leq d \cdot H_{i,S}(g)^{-a_i} \cdot T^{a_i},
\]

where \( d = \delta_0^{-a_i} \cdot \tau^S(B_2 \cap G^S) \). Also, for \( H_{i,S}(g) > T \delta_0^{-1}, y_T(g) = 0 \).

Hence by applying (4.30) once more now to \( h = e \), we obtain the inequality (4.29). Since \( H_{i,S}^{-1} \in L^1(G_S) \) by Lemma 4.2, it follows that \( y_T \) belongs to \( L^1(G_S) \). Since by Theorem 4.13,

\[
y_T(g) \to \gamma_W, s(s_g^{-1}) H_{i,S}(g)^{-a_i} \gamma_W^S(e)^{-1}
\]

as \( T \to \infty \), we apply the dominated convergence theorem to (4.28) and deduce that

\[
\lim_{T \to \infty} \frac{\int_{B_T \cap G_{W_T}} \psi \, d\tau_{W_T}}{\tau^S(B_{T} \cap G_{W_T} \cap G^S)} = \gamma_{W_T}^S(e)^{-1} \int_{G_S} \psi(g) \gamma_W^S(s_g^{-1}) H_{i,S}(g)^{-a_i} \, ds(g).
\]

Using \( \gamma_W^S(s_g^{-1}) = \gamma_{W_T}(g) \) and the definition of the measure \( \mu_{i,W_T,S} \), we have

\[
(4.31) \quad \lim_{T \to \infty} \frac{\int_{B_T \cap G_{W_T}} \psi \, d\tau_{W_T}}{\tau^S(B_{T} \cap G_{W_T} \cap G^S)} = \tilde{\mu}_i(\psi) \cdot \gamma_{W_T}(e)^{-1}.
\]
Taking $\psi = 1$, we also get
\begin{equation}
\lim_{T \to \infty} \frac{\tau_{W_f}(B_T \cap G_{W_f})}{\tau^S(B_T \cap G_{W_f} \cap G^S)} = \gamma_{W_f}(e)^{-1}.
\end{equation}
Therefore combining (4.31) and (4.32), we obtain
\begin{equation}
\lim_{T \to \infty} \frac{\int_{B_T \cap G_{W_f}} \psi \, d\tau_{W_f}}{\tau_{W_f}(B_T \cap G_{W_f})} = \tilde{\mu}_i(\psi).
\end{equation}

5. Equidistribution for saturated cases

Let $G$ be a connected adjoint semisimple group defined over $K$ and let $\iota$ be a faithful representation of $G$ to $GL_N$ defined over $K$ which has a unique maximal weight. We recall that $\iota : G \to GL_N$ is called saturated if the set
\begin{equation}
\{ \alpha \in \Delta : \frac{u_\alpha + 1}{m_\alpha} = a_\iota \}
\end{equation}
is not contained in the root system of a proper normal subgroup of $G$.

Fix a height function $H_\iota$ on $G(\mathbb{A})$ associated to $\iota$, and let $\tilde{\mu}_i$ be the probability measure on $X_\iota$ constructed in Theorem 4.18 (associated to $H_\iota$).

**Theorem 5.2.** – Suppose that $\iota$ is saturated. For $\psi \in C(X_\iota)$,
\begin{equation}
\lim_{T \to \infty} \frac{1}{\tau_{W_f}(B_T \cap G_{W_f})} \sum_{g \in G(K) : H_\iota(g) < T} \psi(g) = \int_{X_\iota} \psi \, d\tilde{\mu}_i
\end{equation}
where $W_f$ is any co-finite subgroup of $W_\iota$.

Note that by Corollary 4.16, the above equality is independent of $W_f$. To derive the asymptotic formula for the number of $K$-rational points, it suffices to take $\psi = 1$ in Theorem 5.2, and hence we obtain Theorem 1.10.

**Corollary 5.3.** – If $\iota$ is saturated, we have, as $T \to \infty$,
\begin{equation}
\# \{ g \in G(K) : H_\iota(g) < T \} \sim \tau_{W_f}(B_T \cap G_{W_f})
\end{equation}
for any co-finite subgroup $W_f$ of $W_\iota$.

Combining Theorem 5.2 with Theorem 4.13, we deduce Theorems 1.2 (without an error term) and 1.6 for the saturated case. The rate of convergence as well as the nonsaturated case are discussed in the next section.

**Remark 5.4.** – Note that for any finite $S$, the projection of $\tilde{\mu}_i$ to $X_{i,S}$ is $\tilde{\mu}_{i,S}$, which is equivalent to a Haar measure on $G_S$ by Proposition 4.22. Any open subset $X_i$ contains a subset of the form $V_S X_{R,-S}$ where $V_S$ is an open subset of $X_{i,S}$, which again contains $(g_{W_f} \cap G_S)G^S$ for some $g \in G_S$ and some co-finite subgroup $W_f$ of $W_\iota$. Now
\begin{equation}
\tilde{\mu}_i((g_{W_f} \cap G_S)G^S) = \tilde{\mu}_{i,S}(g_{W_f} \cap G_S) > 0.
\end{equation}
This shows that $\tilde{\mu}_i$ has full support on $X_i$.

The rest of section is devoted to a proof of Theorem 5.2. We recall the following facts:
Lemma 5.5. – Let $G$ be a connected semisimple adjoint $K$-group, $\iota : G \rightarrow GL(V)$ a $K$-rational representation of $G$, and let $M$ be a connected normal $K$-subgroup of $G$. 

1. There exists a connected normal $K$-subgroup $N$ of $G$ so that $G = MN$ and $M \cap N = \{e\}$, and $M$ is semisimple adjoint.
2. For each $x \in N(\mathbb{A})$, the function $g \mapsto H_\iota(gx)$ defines a height function on $M(\mathbb{A})$ with respect to the restriction $\iota|_M$.
3. If $\iota$ has a unique maximal weight $\lambda_\iota$, then the restriction $\iota|_M$ has a unique maximal weight.

Proof. – (1) follows directly from Proposition 3.30. Let $x \in N(\mathbb{A})$. Whenever $x \in N(K_v) \cap W_v$, which is the case for almost all $v$, we have $H_\iota(x) = H_\iota(g)$ for all $g \in M(K_v)$. Using this, it is easy to verify that the function $g \mapsto H_\iota(gx)$ is a height function as defined in Definition 2.3.

For (3), let $T$ be a maximal torus of $G$ defined over $K$, $\Pi$ denote the set of all weights of $\iota$ with respect to $T$, and $\Pi'$ denote the set obtained by restricting elements of $\Pi$ to $M \cap T$. If $V = \bigoplus_{\iota \in \Pi} V_\lambda$ is the weight space decomposition for $\iota$, the weight space decomposition for $\iota|_M$ is of the form $V = \bigoplus_{\beta \in \Pi'} W_\beta$ where $W_\beta := \bigoplus\{V_\lambda : \lambda|_T \cap M = \beta\}$. In particular, any weight of $\iota|_M$ is the restriction of a weight of $\iota$ to $T \cap M$. Hence if $\beta_\iota$ is the restriction of $\lambda_\iota$ to $T \cap M$, and $\beta \in \Pi'$, not equal to $\beta_\iota$, then $\beta_\iota - \beta$ is a non-zero sum of positive roots of $M$ with respect to $M \cap T$. Therefore $\beta_\iota$ is the unique maximal weight of $\iota|_M$. \hfill $\square$

Lemma 5.6. – The following are equivalent.

1. $\iota$ is saturated.
2. For any proper connected normal $K$-subgroup $M$ of $G$,
$$\tau_M(B_T \cap M(\mathbb{A})) = O(T^{a_\iota}(\log T)^{b_\iota - 2})$$

where $\tau_M$ is a Haar measure on $M(\mathbb{A})$.

Proof. – Assume (1). Since $\iota$ has a unique maximal weight, the restriction $\iota|_M$ of $\iota$ has a unique maximal weight as well. There exists a connected normal $K$-subgroup $N$ of $G$ so that $G = MN$ and $M \cap N = \{e\}$. By Lemma 2.4, without loss of generality, we may assume that $H_\iota$ is the product of height functions $H_\iota|_M$ and $H_\iota|_N$ and $H_\iota(e) = 1$. Hence $B_T \cap M(\mathbb{A}) = \{x \in M(\mathbb{A}) : H_\iota|_M(x) \leq T\}$. Hence by Theorem 4.13,
$$\tau_M(B_T \cap M(\mathbb{A})) \sim c \cdot T^{a_\iota}(\log T)^{b_\iota - 1}$$

where $a$ and $b$ are defined as in (4.1) for $\iota|_M$. Now the saturated condition means that $a = a_\iota$ and $b \leq b_\iota - 1$. Hence (2) holds. To show the other direction, suppose that $\iota$ is not saturated. Then there exist connected proper normal $K$-subgroups $M$ and $N$ of $G$ as above such that $\{\alpha \in \Delta : u_\alpha + 1 = a_\iota \cdot m_\alpha\}$ is contained in the root system of $M$. By Theorem 4.13, there exists $c > 0$ such that for all large $T$,
$$\tau_M(B_T \cap M(\mathbb{A})) \geq c \cdot T^{a_\iota}(\log T)^{b_\iota - 1}.$$ 

Hence (2) does not hold. \hfill $\square$

The following lemma is the main reason why we need the assumption of $\iota$ being saturated for the proof of Theorem 5.2.

By Lemma 5.5, $G$ is a product of connected $K$-simple adjoint subgroups.
Lemma 5.7. Suppose that \( \nu \) is saturated. Write \( \mathbf{G} = \mathbf{G}_1 \times \cdots \times \mathbf{G}_m \) as a product of connected \( K \)-simple subgroups. Then for any fixed \( C > 0 \),
\[
\lim_{{T \to \infty}} \frac{\tau_{W_f}((B_T - B^C) \cap G_{W_f})}{\tau_{W_f}(B_T \cap G_{W_f})} = 0
\]
where \( B^C := \{(g_1, \ldots, g_m) \in \mathbf{G}(\mathbb{A}) : H_i(g_i) > C \text{ for each } i = 1, \ldots, m\} \).

Proof. Since \( G_{W_f} \) is non-compact, \( \tau_{W_f}(B_T \cap G_{W_f}) \to \infty \) as \( T \to \infty \). If \( m = 1 \), the claim follows immediately from this. Suppose \( m \geq 2 \). Without loss of generality, we may assume that \( H_i(g_1, \ldots, g_m) = \prod_{i=1}^m H_i(g_i) \). For each \( i \), let \( B^C_i \) denote the subset of \( B_T \) consisting of \( g = (g_1, \ldots, g_m) \) with \( H_i(g_i) \leq C \). If we denote by \( \tau_i \) and \( \tau^i \) Haar measures on \( \mathbf{G}_i(\mathbb{A}) \) and \( \prod_{j \neq i} \mathbf{G}_j(\mathbb{A}) \) such that \( \tau_{W_f} = (\tau_i \times \tau^i)|_{G_{W_f}} \), then
\[
\tau_{W_f}(B^C_i) \leq C_0 \cdot \tau^i(\{g' \in \prod_{j \neq i} \mathbf{G}_j(\mathbb{A}) : H_i(g') < \delta^{-1}_i \cdot T\})
\]
where \( \delta_i = \inf_{g \in \mathbf{G}_i(\mathbb{A})} H_i(g) \) and \( C_0 = \tau_i(\{g \in \mathbf{G}_i(\mathbb{A}) : H_i(g) \leq C\}) \).

By the previous lemma, for some \( c_i > 0 \),
\[
\tau^i(\{g' \in \prod_{j \neq i} \mathbf{G}_j(\mathbb{A}) : H_i(g') < \delta^{-1}_i \cdot T\}) = O(T^{a_i}(\log T)^{b_i-2}).
\]

Hence for each \( i \),
\[
\lim_{{T \to \infty}} \frac{\tau_{W_f}(B^C_i \cap G_{W_f})}{\tau_{W_f}(B_T \cap G_{W_f})} = 0.
\]
Since \( B_T - B^C \subset \bigcup_{i=1}^m B^C_i \), this proves the claim. \( \square \)

In the following, we fix a co-finite subgroup \( W_f \) of \( W_f \). Set
\[
Y_{W_f} = \mathbf{G}(K) \backslash G_{W_f}.
\]

For a fixed \( \psi \in C(X_{W_f}) \), we define a function \( F_T \) on \( G_{W_f} \times G_{W_f} \) by
\[
F_T(g, h) = \sum_{\gamma \in \mathbf{G}(K)} \psi(g^{-1} \gamma h) \cdot \chi_{B_T}(g^{-1} \gamma h).
\]

Since \( B_T \) is a compact subset of \( \mathbf{G}(\mathbb{A}) \), the above sum is finite and since \( F_T \) is \( \mathbf{G}(K) \times \mathbf{G}(K) \)-invariant, we may consider \( F_T \) as a function on \( Y_{W_f} \times Y_{W_f} \).

Note that
\[
F_T(e, e) = \sum_{\gamma \in \mathbf{G}(K): H_i(\gamma) \leq T} \psi(\gamma).
\]

Proposition 5.8 (Weak-convergence). Suppose that \( \nu \) is saturated. For \( i = 1, 2 \), let \( \alpha_i \in C(Y_{W_f}) \) be a \( W_f \)-invariant function and \( \int_{Y_{W_f}} \alpha_i \, d\tau_{W_f} = 1 \). If \( \alpha(x, y) = \alpha_1(x)\alpha_2(y) \), then
\[
\lim_{{T \to \infty}} \frac{1}{\tau_{W_f}(B_T \cap G_{W_f})} \int_{Y_{W_f} \times Y_{W_f}} F_T \cdot \alpha \, d(\tau_{W_f} \times \tau_{W_f}) = \int_{X_k} \psi \, d\tilde{\mu}.
\]
\textbf{Proof.} – Observe that \( \alpha \) is \( W_f \times W_f \)-invariant and
\begin{equation}
\langle F_T, \alpha \rangle_{W_f \times W_f} =
= \int_{x \in Y_f} \int_{y \in Y_f} \sum_{\gamma \in G(K)} \psi(x^{-1} \gamma y) \chi_{B_f}(x^{-1} \gamma y) \alpha_1(x) \alpha_2(y) \, d\tau_{W_f}(y) \, d\tau_{W_f}(x)
= \int_{x \in Y_f} \int_{h \in G_{W_f}} \psi(x^{-1} h) \chi_{B_f}(x^{-1} h) \alpha_1(x) \alpha_2(h) \, d\tau_{W_f}(h) \, d\tau_{W_f}(x)
= \int_{g \in G_{W_f}} \psi(g) \chi_{B_f}(g) \left( \int_{x \in Y_f} \alpha_1(x) \alpha_2(xg) \, d\tau_{W_f}(x) \right) \, d\tau_{W_f}(g)
= \int_{g \in B_f \cap G_{W_f}} \psi(g) (\alpha_1, g \cdot \alpha_2) \, d\tau_{W_f}(g).
\end{equation}

As in the above lemma 5.7, we write \( G = G_1 \times \cdots \times G_m \). Now for a sequence \( \{ g \in G(\mathbb{A}) \} \), that \( g \to \infty \) strongly means precisely the \( G_i(\mathbb{A}) \)-component \( g_i \) of \( g \) tends to \( \infty \) for each \( 1 \leq i \leq m \). Since the height function \( H_i \) is proper, this is again equivalent to saying that \( H_i(g_i) \to \infty \) for each \( i = 1, \ldots, m \).

For \( i = 1, 2 \), we claim that \( \alpha_i - 1 \in L^2_0(Y_{W_f}) \), that is, for any automorphic character \( \chi \) of \( G(\mathbb{A}) \),
\[ \int_{Y_{W_f}} \alpha \cdot \chi \, d\tau_{W_f} = \int_{Y_{W_f}} \chi \, d\tau_{W_f}. \]
If \( \chi \) is \( W_f \)-invariant, then \( \chi = 1 \) on \( G_{W_f} \). Since \( \int_{Y_{W_f}} \alpha \, d\tau_{W_f} = 1 \), the claim is clear. If \( \chi \in \Lambda - \Lambda^{W_f} \), we only need to apply Lemma 4.12 for \( \psi = \alpha - 1_{Y_f} \), where \( 1_{Y_f} \) is the characteristic function of \( Y_{W_f} \), since we may consider \( \psi \) as a function on \( G(K) \backslash G(\mathbb{A}) \) which is 0 outside \( Y_{W_f} \).

Hence, by Theorem 3.28, for any given \( \varepsilon > 0 \), there exists \( C > 0 \) such that for all \( g \in B^C \),
\begin{equation}
|\alpha_1, g \cdot \alpha_2 - 1| = |\alpha_1 - 1, g \cdot (\alpha_2 - 1)| < \varepsilon.
\end{equation}

Hence
\[ \left| \int_{g \in B_f \cap G_{W_f}} \psi(g)(\alpha_1, g \cdot \alpha_2) \, d\tau_{W_f}(g) - \int_{g \in B_f \cap G_{W_f}} \psi(g) \, d\tau_{W_f}(g) \right| < \sup |\psi| (||\alpha_1|| \cdot ||\alpha_2|| + 1) \cdot \tau_{W_f}((B_f - B^C) \cap G_{W_f}) + \varepsilon \sup |\psi| \cdot \tau_{W_f}(B_f \cap B^C \cap G_{W_f}) \]
where \( ||\alpha_i|| \) is the \( L^2 \)-norm of \( \alpha_i \in L^2(Y_{W_f}) \) for each \( i \). By Lemma 5.7, it follows that
\[ \lim_{T \to \infty} \frac{1}{\tau_{W_f}(B_f \cap G_{W_f})} \int_{g \in B_f \cap G_{W_f}} \psi(g)(\alpha_1, g \cdot \alpha_2 - 1) \, d\tau_{W_f}(g) \leq \varepsilon \sup |\psi|. \]
Since \( \varepsilon > 0 \) is arbitrary, by (5.9), this proves
\[ \lim_{T \to \infty} \frac{1}{\tau_{W_f}(B_f \cap G_{W_f})} \int_{Y_{W_f} \times Y_{W_f}} F_T \cdot \alpha \, d(\tau_{W_f} \times \tau_{W_f}) = \lim_{T \to \infty} \frac{\int_{B_f \cap G_{W_f}} \psi \, d\tau_{W_f}}{\tau_{W_f}(B_f \cap G_{W_f})}. \]
By Lemma 4.27, this proves Proposition 5.8. 

Proof of Theorem 5.2. – It suffices to prove our theorem for nonnegative functions \( \psi \in C(X, \omega_W) \) for each co-finite subgroup \( W_f \) of \( W \). Fix \( \varepsilon > 0 \). Let \( W_\infty \) be a symmetric neighborhood of \( e \) in \( G_\infty \) such that

\[
W_\infty B_T W_\infty \subset B_{(1+\varepsilon)T} \quad \text{and} \quad B_{(1-\varepsilon)T} \subset \bigcap_{g, h \in W_\infty} gB_T h \quad \text{for all } T > 1.
\]

By the uniform continuity of \( \psi \), replacing \( W_\infty \) by a smaller one if necessary, we may assume that

\[
\psi(g^{-1} x) - \varepsilon \leq \psi(x) \leq \psi(g^{-1} x) + \varepsilon \quad \text{for all } x \in X \text{ and } g, h \in W_\infty.
\]

Define

\[
F_T^\pm(g, h) = \sum_{\gamma \in G(K)} (\psi(g^{-1} \gamma h) \pm \varepsilon) \cdot \chi_{B_T}(g^{-1} \gamma h).
\]

We claim that for any \( T > 1 \) and for any \( g, h \in W := W_\infty \times W_f \),

\[
F_{(1-\varepsilon)T}^-(g, h) \leq F_T(e, e) \leq F_{(1+\varepsilon)T}^+(g, h),
\]

To see this, observe that if \( \gamma \in G(K) \) with \( H_\gamma(\gamma) < T \), and \( g, h \in W \) then

\[
H_\gamma(g^{-1} \gamma h) \leq (1 + \varepsilon)T \quad \text{and} \quad f(\gamma) \leq \psi(g^{-1} \gamma h) + \varepsilon.
\]

Hence

\[
F_T(e, e) = \sum_{\gamma \in G(K), H_\gamma(\gamma) < T} \psi(\gamma) \leq \sum_{\gamma \in G(K), H_\gamma(g^{-1} \gamma h) < (1 + \varepsilon)T} (\psi(g^{-1} \gamma h) + \varepsilon) = F_{(1+\varepsilon)T}^+(g, h),
\]

proving the right inequality in (5.12). The other inequality can be proved similarly. Now let \( \phi \in C_c(Y_{W_f}) \) be a non-negative \( W_f \)-invariant function such that \( \text{supp}(\phi) \subset G(K) \setminus G(K)W \) and \( \int_{Y_{W_f}} \phi d\tau_{W_f} = 1 \). By integrating (5.12) over \( Y_{W_f} \times Y_{W_f} \) against the function \( \alpha(x, y) = \phi(x) \cdot \phi(y) \), we obtain

\[
\langle F_{(1-\varepsilon)T}, \alpha \rangle \leq F_T(e, e) \leq \langle F_{(1+\varepsilon)T}, \alpha \rangle.
\]

Note that Theorem 4.13 implies the following: there exist sequences \( \{a_\varepsilon \geq 1\} \) and \( \{b_\varepsilon \leq 1\} \) such that \( a_\varepsilon \to 1 \) and \( b_\varepsilon \to 1 \) as \( \varepsilon \to 0 \) for all sufficiently small \( \varepsilon > 0 \),

\[
b_\varepsilon \leq \liminf_T \frac{\tau_{W_f}(B_{(1-\varepsilon)T} \cap G_{W_f})}{\tau_{W_f}(B_{T} \cap G_{W_f})} \leq \limsup_T \frac{\tau_{W_f}(B_{(1+\varepsilon)T} \cap G_{W_f})}{\tau_{W_f}(B_{T} \cap G_{W_f})} \leq a_\varepsilon.
\]

Hence by applying Proposition 5.8,

\[
\limsup_T \frac{F_T(e, e)}{\tau_{W_f}(B_T \cap G_{W_f})} \leq \limsup_T \frac{\langle F_{(1+\varepsilon)T}, \alpha \rangle}{\tau_{W_f}(B_T \cap G_{W_f})} \leq \limsup_T \frac{\langle F_{(1+\varepsilon)T}, \alpha \rangle}{\tau_{W_f}(B_{(1+\varepsilon)T} \cap G_{W_f})} \cdot \limsup_T \frac{\tau_{W_f}(B_{(1+\varepsilon)T} \cap G_{W_f})}{\tau_{W_f}(B_T \cap G_{W_f})} \leq a_\varepsilon \cdot \left( \int_{X,} \psi + \varepsilon \right) d\mu_{W_f} \leq a_\varepsilon \cdot \left( \int_{X,} \psi d\mu_{W_f} + \varepsilon \right)
\]

and similarly,

\[
b_\varepsilon \cdot \left( \int_{X,} \psi d\mu_Y + \varepsilon \right) \leq \liminf_T \frac{F_T(e, e)}{\tau_{W_f}(B_T \cap G_{W_f})}.
\]
Taking $\varepsilon \to 0$,
\[
\lim_{T} \frac{F_T(\varepsilon, \varepsilon)}{\tau_{W_j}(B_T \cap G_{W_j})} = \int_{X} \psi \, d\mu_{\varepsilon, W_j}.
\]
This finishes the proof of Theorem 5.2.

In fact, for the case $\psi = 1$, the computation in the proof of Theorem 5.2 can be simplified significantly, and it applies to general families of balls $B_T$, which we presently introduce.

For an increasing sequence $\{B_T\}$ of relatively compact subsets of $G(\mathbb{A})$ and a compact open subgroup $W_f \subset G(k_f)$, we call $\{B_T\}$ $W_f$-well rounded if the following holds:

1. $W_f B_T W_f = B_T$ for any $T > 1$;
2. for any small $\varepsilon > 0$, there exists a neighborhood $W_{\varepsilon} \subset G_{\infty}$ of $\varepsilon$ such that
   \[W_{\varepsilon} B_T W_{\varepsilon} \subset B_{(1+\varepsilon)T} \quad \text{and} \quad B_{(1-\varepsilon)T} \subset \bigcap_{g, h \in W_{\varepsilon}} gB_T h\]

for all $T > 1$;
3. $\tau_{W_j}(B_T \cap G_{W_j}) \to \infty$ as $T \to \infty$ and there exist constants $a_{\varepsilon} \geq 1$ and $b_{\varepsilon} \leq 1$ tending to $1$ as $\varepsilon \to 0$ such that for all sufficiently small $\varepsilon > 0$,
   \[b_{\varepsilon} \leq \lim\inf_{T} \frac{\tau_{W_j}(B_{(1-\varepsilon)T} \cap G_{W_j})}{\tau_{W_j}(B_T \cap G_{W_j})} \leq \lim\sup_{T} \frac{\tau_{W_j}(B_{(1+\varepsilon)T} \cap G_{W_j})}{\tau_{W_j}(B_T \cap G_{W_j})} \leq a_{\varepsilon}.
\]

The proof of Theorem 5.2 gives

**Proposition 5.14.** – Let $G$ be a connected absolutely almost simple $K$-group, and let $W_f$ be a compact open subgroup of $G(k_f)$. Then for any $W_f$-well rounded sequence $\{B_T\}$ of relatively compact subsets of $G(\mathbb{A})$,

\[\# G(K) \cap B_T \sim_{T \to \infty} \tau_{W_f}(B_T \cap G_{W_f}).\]

6. Arithmetic fibrations and construction of $\mu_{\varepsilon}$

In this section we prove the main theorems for a general case, that is, without the saturation assumption on $\iota$. We let $G$ be a connected semisimple adjoint group defined over $K$ and $\iota$ a faithful representation of $G$ to $\text{GL}_N$ defined over $K$ which has a unique maximal weight $\lambda_\iota$. Fix a height function $H_\iota$ on $G(\mathbb{A})$ associated to $\iota$.

Let $T, \Phi(G, T), \Delta, 2p = \sum_{\alpha \in \Delta} u_{\alpha, \lambda_\iota, \alpha} = \sum_{\alpha \in \Delta} m_{\alpha} \lambda_\iota$ and $a_{\iota, b_i}$ be as defined in Section 1.2. Let $M$ be the smallest connected normal $K$-subgroup of $G$ whose root system contains the set

\[\left\{ \alpha \in \Delta : \frac{u_{\alpha} + 1}{m_{\alpha}} = a_i \right\}.
\]

Let $N$ be a connected normal $K$-subgroup of $G$ such that $G = MN$ and $M \cap N = \{e\}$. Let $\pi : G \to N$ be the canonical projection. Note that any element of $G(\mathbb{A})$ can be uniquely written as $g_1 g_2$ with $g_1 \in M(\mathbb{A})$ and $g_2 \in N(\mathbb{A})$. We denote by $\tau_M$ the Haar measure on $M(\mathbb{A})$ such that $\tau_M(M(\mathbb{A})/M(K)) = 1$.

For each $x \in N(\mathbb{A})$, the function $H_\iota^x (g) := H_\iota(g x)$ defines a height function on $M(\mathbb{A})$ with respect to $\iota' := \iota|M$, and $\iota'$ has a unique maximal weight by Lemma 5.5. Also the definition of $M$ implies that $\iota'$ is saturated, $a_{\iota'} = a_{\iota}$ and $b_{\iota'} = b_{\iota}$. Set

\[V_\iota := M(\mathbb{A}_f) \cap W_\iota.
\]
Then Theorems 1.2 and 5.2 (for the saturated cases) imply that for each $x \in \mathbb{N}(K)$,

1. there exists $c_x > 0$ such that

\begin{equation}
N_{\pi^{-1}(x)}(H_i, T) = \#\{g \in \mathcal{M}(K) : H_i(gx) < T\} \sim c_x \cdot T^{\alpha_i}(\log T)^{b_i-1};
\end{equation}

2. the following number

$$r_{x,i} = \sum_{\chi \in \Lambda} \lim_{s \to a_i^+} (s - a_i)^b_i \int_{\mathcal{M}(\Lambda)} H_i(gx)^{-s} \chi(g) \, d\tau_M(g)$$

is a positive real number;

3. if $X_M$ denotes the closed subspace $\prod_{\tau \in \mathcal{M}(K)} \mathcal{V}(\mathcal{M}(K))$ of $X_i$, there exists a probability measure $\tilde{\mu}_{x,i}$ on $X_M$ such that for any $\psi \in C(X_M)$ which is invariant under a co-finite subgroup of $V_i$, $\tilde{\mu}_{x,i}(\psi) = r_{x,i}^{-1} \sum_{\chi \in \Lambda} \lim_{s \to a_i^+} (s - a_i)^b_i \int_{\mathcal{M}(\Lambda)} H_i(gx)^{-s} \chi(g) \, d\tau_M(g)$.

Noting that $N(H_i, T) = \sum_{x \in \mathbb{N}(K)} N_{\pi^{-1}(x)}(H_i, T)$, we restate Theorem 1.2 in the introduction.

**Theorem 6.2.** – We have

1. $c_{H_i} := \sum_{x \in \mathbb{N}(K)} c_x < \infty$;
2. for some $\delta > 0$,

\begin{equation}
N(H_i, T) = c_{H_i} \cdot (\log T)^{b_i-1}(1 + O((\log T)^{-\delta})).
\end{equation}

Set for $T > 0$ and $x \in \mathbb{N}(\Lambda)$,

$$B_T^x = \{g \in \mathcal{M}(\Lambda) : H_i^x(g) < T\}.$$ 

Since $x$ commutes with $\mathcal{M}(\Lambda)$, each height function $H_i^x$ on $\mathcal{M}(\Lambda)$ is invariant under $V_i$. Let $Y_M = \mathcal{M}(K) \backslash M_{V_i}$ and $\tau$ be the invariant probability measure on $Y_M$. For each $x \in \mathbb{N}(K)$, set

$$F_T^x(g, h) := \sum_{\gamma \in \mathcal{M}(K)} \chi_{B_T^x}(g^{-1} \gamma h), \quad g, h \in \mathcal{M}(\Lambda).$$

We may consider $F_T^x$ as a function on $Y_M \times Y_M$. Write $\mathcal{M} = \mathcal{M}_1 \cdots \mathcal{M}_r$ as a product of connected $K$-simple $K$-groups and denote by $\tau_i$ the invariant probability measure on $\mathcal{M}_i(K) \backslash \mathcal{M}_i(\Lambda) \cap M_{V_i}$. For a collection of smooth $(W_i \cap \mathcal{M}_i(\Lambda))$-invariant functions $\psi_i \in C_c(\mathcal{M}_i(K) \backslash \mathcal{M}_i(\Lambda) \cap M_{V_i})$, such that $\int \psi_i \, d\tau_i = 1$ for each $1 \leq i \leq r$, define $\psi \in C_c(Y_M)$ and $\alpha \in C_c(Y_M \times Y_M)$ by

$$\psi(z_1, \ldots, z_r) := \prod_{i=1}^r \psi_i(z_i) \quad \text{and} \quad \alpha(y_1, y_2) := \psi(y_1)\psi(y_2).$$

**Lemma 6.4.** – 1. There is a constant $c > 0$ such that for any $x \in \mathbb{N}(K)$,

$$c_x \leq c \cdot H_i(x)^{-\alpha_i}.$$
2. There exist \( l \in \mathbb{N} \) and \( \delta > 0 \), independent of \( x \), such that for any \( x \in \mathbf{N}(K) \) and \( T \gg H_2(x) \),

\[
\langle F_T^x, \alpha \rangle_{Y_M \times Y_M} = c_x \cdot T^{a_x} (\log T)^{b_x - 1} + O(d_x \cdot C_{\psi} \cdot T^{a_x} (\log T)^{b_x - 1 - \delta})
\]

where \( d_x = H_1(x)^{-a_x} (\log H_1(x))^{b_x - 1} \) and \( C_{\psi} = \max(1, \max_i \|D^i \psi_i\|^{2r}) \) and \( D \) is the elliptic operator defined in (3.26).

Proof. – As in the proof of Proposition 5.8, we derive that

\[
\langle F_T^x, \alpha \rangle = \int_{g \in B_T^x \cap M_V} \langle \psi, g \cdot \psi \rangle \, d\tau(g).
\]

Note that

\[
|\langle \psi, g \cdot \psi \rangle - 1| = \left| \prod_{i=1}^{r} \langle \psi_i, g_i \cdot \psi_i \rangle - 1 \right| = \left| \sum_{i=1}^{r} \prod_{j=1}^{-1} \langle \psi_j, g_j \cdot \psi_j \rangle (\langle \psi_i, g_i \cdot \psi_i \rangle - 1) \right|
\]

\[
\leq r \cdot C_\psi \cdot \max \left| \langle \psi_i, g_i \cdot \psi_i \rangle - 1 \right| = r \cdot C_\psi \cdot \max \left| \langle \psi_i - 1, g_i \cdot (\psi_i - 1) \rangle \right|
\]

where \( C_\psi = \max(1, \max_i \|\psi_i\|^{2r-2}) \). Since \( \psi_i - 1 \in L_{20}^2(M_i(K) \setminus M_i(\mathbb{A}) \cap M_V) \) for each \( i \), we deduce from Theorem 3.27 that

\[
(6.5) \quad \langle F_T^x, \alpha \rangle - \tau(B_T^x \cap M_V)
\]

\[
\leq 2r \cdot \left( \prod_{i=1}^{r} C_{\psi, i} \cdot M_i(\mathbb{A}) \right) \cdot C_{\psi} \cdot \int_{g = g_1 \ldots g_r \in B_T^x \cap M_V} \left( \max_i \xi_M(g_i)^{1/2} \right) \, d\tau(g)
\]

where \( C_{\psi, i} = \max(1, \max_i \|D^i \psi_i\|^{2r}) \) for some large \( l \).

Since \( \xi_M \leq \xi_M^{1/2} \), it follows from Lemma 3.6 that there exist \( m \in \mathbb{N} \) and \( C_1 > 0 \) such that for any \( 1 \leq i \leq r \),

\[
(6.6) \quad \xi_M^{1/2}(g_i) < C_1 \cdot H_i(g_i)^{-1/m} \quad \text{for any } g_i \in M_i(\mathbb{A}).
\]

Define a function on \( M(\mathbb{A}) \) by

\[
\tilde{H}(g_1 \cdots g_r) := \min H_i(g_i), \quad g_i \in M_i(\mathbb{A}).
\]

Let \( \kappa \) be as in Lemma 2.4 for \( G_1 = M \) and \( G_2 = \mathbb{N} \) so that \( B_T^x \subset B_{\kappa \cdot H_2(x)} \). It then follows from (6.5) that

\[
\langle F_T^x, \alpha \rangle - \tau(B_T^x \cap M_V) < C_2 \cdot C_{\psi} \cdot \int_{B_{\kappa \cdot H_2(x)}} \tilde{H}(g)^{-1/m} \, d\tau(g)
\]

for a constant \( C_2 > 0 \) independent of \( x \).

Since \( \psi \) is saturated, by Lemma 5.6, for every proper normal \( K \)-subgroup \( L \) of \( M \),

\[
\tau_L(B_T \cap L(\mathbb{A})) \ll (\log T)^{-1} \tau(B_T \cap M_V)
\]

where \( \tau_L \) is a Haar measure on \( L(\mathbb{A}) \).

For each \( C > 1 \), set

\[
B^C = \{ g \in M(\mathbb{A}) : \tilde{H}(g) > C \}.
\]

Note that

\[
(B_T - B^C) \cap M_V \subset \bigcup_{i=1}^{r} \Omega_i
\]
where \( \Omega_i = \{ g = g_1 \cdots g_r \in M_{V_i} : H_i(g_i) \leq C, H_i(g) < T \} \). Now denoting by \( L^{(i)} \) the subgroup of \( M \) generated by \( M_1, \ldots, M_{i-1}, M_{i+1}, \ldots, M_r \), let \( \kappa_i > 1 \) be a constant as in Lemma 2.4 for \( G_1 = M_i \) and \( G_2 = L^{(i)} \). Let \( \delta_0 := \inf_{g \in G(t)} H_i(g) > 0 \) (Lemma 2.5). Then for any \( C \gg 1 \),

\[
\tau(\Omega_i) \leq \int_{H_i(g_i) < C} \tau_{L^{(i)}}(B_{\kappa_i \delta_0^{-1}} \cap L^{(i)}(\alpha_i g_i)) d\tau_M(g_i) \ll C^{a_i}(\log C)^{b_i-1}(\log T)^{-1} \tau(B_{\kappa_i T} \cap M_{V_i})
\]

where \( \kappa_0 = \max_i (\kappa_i \delta_0^{-1}) \).

Hence for any \( C \gg 1 \) and \( T \gg C \),

\[
\tau((B_{T} - B^C) \cap M_{V_i}) \ll C^{a_i}(\log C)^{b_i-1}(\log T)^{-1} \tau(B_{\kappa_0 T} \cap M_{V_i}).
\]

Therefore

\[
\int_{B_T \cap M_{V_i}} \tilde{H}^{-1/m} d\tau = \int_{B_T \cap B^C \cap M_{V_i}} \tilde{H}^{-1/m} d\tau + \int_{(B_T - B^C) \cap M_{V_i}} \tilde{H}^{-1/m} d\tau
\]

\[
\ll (C^{-1/m} + \delta_0^{1/m} \cdot C^a (\log C)^{b_i-1} (\log T)^{-1} \cdot \tau(B_{\kappa_0 T} \cap M_{V_i})
\]

\[
\ll (\log T)^{-\delta} \cdot \tau(B_{\kappa_0 T} \cap M_{V_i}) \quad \text{for } C = (\log T)^{1/(2a)}
\]

for some \( \delta > 0 \). We now deduce from (6.6) and (6.7) that

\[
(F^x_T, \alpha) = \tau(B_{T}^C \cap M_{V_i}) + O(C^\rho (\log T)^{-\delta} \cdot \tau(B_{\kappa_0 T} \cap M_{V_i}))
\]

for some \( \delta > 0 \). Let \( S \subset R \) be as in the proof of Lemma 2.4, that is, for any \( v \in R - S \),

\[
G(K_v) = U_v A_v^+ U_v \quad \text{and} \quad H_v(g) = \chi(a) \quad \text{for } g = u_1 au_2 \in G(K_v).
\]

Denote by \( \tau_S \) and \( \tau^S \) Haar measures on \( M_S \) and \( M^S \) respectively such that \( \tau = \tau_S \times \tau^S \) locally.

Recall from (4.9) the map \( M_S \to (M_{V_i} \cap M^S) \setminus M^S \) by \( g \to [s_g] \) and as in (4.28) we have

\[
\tau(B_{T}^C \cap M_{V_i}) = \int_{g \in M_S} \tau^S(B_{\kappa T}^{-1}(g) \cap s_g M_{V_i} \cap M^S) d\tau_S(g).
\]

By Theorem 4.13, there is \( c_0 > 0 \) such that for all \( g \in M_S \),

\[
\tau^S(B_{T}^C \cap s_g M_{V_i} \cap M^S) = c_0 \cdot \gamma_V^S(s_g^{-1}) \cdot T^a (\log T)^{b_i-1} + O(T^a (\log T)^{b_i-2}).
\]

Here the implied constant can be taken uniformly for all \( g \in G_S \), since there are only finitely many cosets \( s_g M_{V_i} \subset M^S \).

Note that \( \gamma_V^S(s_g^{-1}) = \gamma_{V_i}^S(g) = \gamma_{V_i}^S(gx) \) since \( x \in N(K) \) and it is bounded. We deduce that when \( H_i(gx) \ll T/\delta_0 \),

\[
\tau^S(B_{\kappa T}^{-1}(gx) \cap M_{V_i} \cap M^S) = c \cdot \gamma_V^S(g) (T \cdot H_i^{-1}(gx))^{a_i} (\log T)^{b_i-1} + O((T \cdot H_i^{-1}(gx))^{a_i} (\log H_i(gx))^{b_i-1} (\log T)^{b_i-2})
\]
for \( c = c(S, V, \kappa) > 0 \). To estimate the integral over the domain \( H_r(gx) \gg T/\delta_0 \), it suffices to note that by Lemma 4.2,

\[
\tau_S(B_T \setminus H_r^{-1}(x) \cap M_S) \ll (T H_r^{-1}(x))^{a_i - \varepsilon}.
\]

Since by Lemmas 2.4 and 4.2,

\[
\int_{g \in M_S} \gamma_{V_i}(g) H_i(gx)^{-a_i} (\log H_i(gx))^{b_i - 1} d\tau_S(g) \ll H_i(x)^{-a_i} (\log H_i(x))^{b_i - 1},
\]

it follows from the above estimates that for \( T \gg H_i(x) \),

\[
\tau(B_T^x \cap M_{V_i}) = c_x T^{a_i} (\log T)^{b_i - 1} + O(d_x T^{a_i} (\log T)^{b_i - 2}),
\]

where

\[
(6.10) \quad c_x = c \cdot \int_{g \in M_S} \gamma_{V_i}(g) H_i(gx)^{-a_i} \, d\tau_S(g) \ll H_i(x)^{-a_i}.
\]

Hence combining (6.8) and (6.9), we have for \( T \gg H_i(x) \),

\[
(F_T^x, \alpha) = c_x \cdot T^{a_i} (\log T)^{b_i - 1} + O(d_x \cdot C_{\alpha} \cdot T^{a_i} (\log T)^{b_i - 1 - \delta}).
\]

A key ingredient in deducing Theorem 6.2 is the following stronger version of (6.1):

**Proposition 6.11.** – There exists \( \delta > 0 \) such that for each \( x \in N(K) \) and for any \( T \gg H_i(x) \),

\[
(6.12) \quad N_{\pi^{-1}(x)}(H_i, T) = c_x \cdot T^{a_i} (\log T)^{b_i - 1} + O(d_x \cdot C_{\alpha} \cdot T^{a_i} (\log T)^{b_i - 1 - \delta})
\]

where \( d_x = H_i(x)^{-a_i} (\log H_i(x))^{b_i - 1} \) and the implied constant is independent of \( x \).

**Proof.** – Let \( \phi_x \) be a smooth symmetric nonnegative function on \( M_\infty \), which is a product \( \prod_{i=1}^s \phi_i(x) \) of smooth functions on the simple factors of \( M_\infty \). \( \int_{M_\infty} \phi_x \, d\tau_\infty = 1 \) and supp(\( \phi_x \)) is contained in the Riemannian ball at \( e \) in \( M_\infty \) of radius \( \varepsilon \), and for some \( \rho > 0 \),

\[
\max_{\gamma \in M(K)} \|D\phi_x\|_{2r} \ll \varepsilon^{-\rho} \quad \text{(see, for example, Lemma 4.4 in [27]).}
\]

By the definition of \( H_i \) in (2.6), there exists \( b > 0 \) such that

\[
\text{supp}(\phi_x) \cdot B_T^x \cdot \text{supp}(\phi_x) \subset B_{(1 + b)T}^x
\]

for every \( T > 1 \) and \( x \in N(K) \).

Define

\[
\psi_x(g) = \frac{1}{\tau^{M_K} (V_i)} \sum_{\gamma \in M(K)} \phi_x(\gamma g_\infty) \cdot \chi_{V_i}(\gamma g_f), \quad g = g_\infty g_f \in M_\infty M(K).
\]

Define \( \alpha_x(y_1, y_2) = \psi_x(y_1) \psi_x(y_2) \) for \( (y_1, y_2) \in Y_M \times Y_M \). Then

\[
N_{\pi^{-1}(x)}(H_i, T) \leq \langle F_{(1 + b)eT}^x, \alpha_x \rangle
\]

\[
= c_x T^{a_i} (\log T)^{b_i - 1} + O(c_x \cdot \varepsilon \cdot T^{a_i} (\log T)^{b_i - 1} + d_x \cdot \varepsilon^{-\rho} T^{a_i} (\log T)^{b_i - 1 - \delta}).
\]

Setting \( \varepsilon = (\log T)^{-\delta/(\rho + 1)} \), we derive the upper estimate for \( N_{\pi^{-1}(x)}(H_i, T) \). The lower estimate is proved similarly. \( \square \)
Proof of Theorem 6.2. – According to the choice of $N$, for any simple root $\alpha \in \Delta$ whose restriction to $N$ is a root, we have

$$u_\alpha + \frac{1}{m_\alpha} < a_\alpha.$$  

Since $N(K)$ is a discrete subgroup of $N(\mathbb{A})$, we can find an open neighborhood $U := U_\infty \times U_f$ of the identity in $N(\mathbb{A})$ such that $\gamma U \cap \gamma' U = \emptyset$ for all $\gamma \neq \gamma' \in N(K)$. We may assume $U_f \subset W$ and $B_2U_\infty \subset B_2T$ for all $T > 1$. Since $\tau_N(\gamma U) = \tau_N(U)$ by the invariance of $\tau_N$, we deduce

$$N_N(H_i, T) = \tau_N(U)^{-1} \cdot \tau_N \left( \bigcup_{\gamma \in N(K): H_i(x) \leq T} \gamma U \right) \leq \tau_N(U)^{-1} \cdot \tau_N(B_2T \cap N(\mathbb{A})).$$

Therefore Theorem 4.13, applied to $\tau_N(B_2T \cap N(\mathbb{A}))$, together with (6.13) yields that there exists $\varepsilon > 0$ such that

$$N_N(H_i, T) = O(T^{a_i - \varepsilon}).$$

Hence setting $\alpha(t) = N_N(H_i, t)$, we have for any $a_\alpha - \varepsilon/2 \leq a \leq a_\alpha$,

$$\sum_{x \in N(K)} H_i(x)^{-a} = \int_0^\infty t^{-a} d\alpha(t) = \alpha \int_0^\infty t^{-a-1} \alpha(t) dt < \int_0^\infty t^{-(1+\varepsilon/2)} dt < \infty.$$

Since $c_x < H_i(x)^{-a_\alpha}$ by (6.10) and $d_x = H_i(x)^{-a_\alpha} (\log H_i(x))^{b_\alpha - 1}$, it follows that

$$c_{H_i} := \sum_{x \in N(K)} c_x < \infty \quad \text{and} \quad \sum_{x \in N(K)} d_x < \infty.$$

Let $\delta_0 > 0$ be as in (2.6) and let $\beta > 0$ be such that Proposition 6.11 holds for all $T > \beta \cdot H_i(x)$. Let $\delta > 0$ be a constant given in the same proposition.

Applying Lemma 2.4 for $M$ and $N$ with $\kappa$ therein, we have

$$\sum_{x \in N(K): H_i(x) > \beta^{-1} T} N_{\pi^{-1}(x)}(H_i, T) = \# \{ xy \in N(K)M(K) : H_i(x) > \beta^{-1} T, \ H_i(xy) < T \} \leq N_M(H_i, \kappa T) \cdot N_N(H_i, \kappa T\delta^{-1}) = O(T^{a_i - \varepsilon}).$$

Now applying Proposition 6.11, since $\sum_{x \in N(K)} d_x < \infty$,

$$\sum_{x \in N(K): H_i(x) \leq \beta^{-1} T} N_{\pi^{-1}(x)}(H_i, T) = \left( \sum_{x \in N(K): H_i(x) \leq \beta^{-1} T} c_x \right) T^{a_i (\log T)^{b_\alpha - 1} + O(T^{a_i (\log T)^{b_\alpha - 1 - \delta}}).$$

Therefore as $T \to \infty$,

$$N(H_i, T) = \sum_{x \in N(K): H_i(x) \leq \beta^{-1} T} N_{\pi^{-1}(x)}(H_i, T) + O(T^{a_i - \varepsilon})$$

$$= \left( \sum_{x \in N(K): H_i(x) \leq \beta^{-1} T} c_x \right) T^{a_i (\log T)^{b_\alpha - 1} (1 + O((\log T)^{-\delta}))}.$$
Since $\sum_{x \in \mathbb{N}(K): H(x) \leq \beta^{-1}T} c_x = C(H_1) + O(T^{-\varepsilon})$, we have

$$N(H_1, T) = C(H_1) \cdot T^{\varepsilon} \cdot (\log T)^{k-1} (1 + O((\log T)^{-\delta}))$$

finishing the proof. \hfill \Box

We now construct the probability measure on $X_i$ in order to prove Theorem 1.6 in the introduction in a general case. We consider each $\tilde{\mu}_{x,i}$ as a measure on $X_i$ since $X_M$ is a closed subspace of $X_i$. For each $x \in \mathbb{N}(K)$, denote by $x, \tilde{\mu}_{x,i}$ the measure defined by

$$(x, \tilde{\mu}_{x,i})(\psi) := \tilde{\mu}_{x,i}(\psi)$$

where $\psi_x(g) = \psi(gx)$. Noting that each $x, \tilde{\mu}_{x,i}$ supported on $X_M$, defines a probability measure $\mu_i$ on $X_i$ by

$$\mu_i = \sum_{x \in \mathbb{N}(K)} \frac{c_x}{c_{H_i}} (x, \tilde{\mu}_{x,i}).$$

Note that $\mu_i = \tilde{\mu}_i$ in the case when $\varepsilon$ is saturated (see Theorem 4.18 for the definition of $\tilde{\mu}_i$).

**Theorem 6.17.** – For any $\psi \in C(X_i)$,

$$\lim_{T \to \infty} \frac{1}{N(H_i, T)} \sum_{g \in G(K): H_i(g) < T} \psi(g) = \int_{X_i} \psi \, d\mu_i.$$

**Proof.** – Let $\psi \in C(X_i)$. We write

$$\mu_T(\psi) = \frac{1}{N(H_i, T)} \sum_{g \in G(K): H_i(g) < T} \psi(g),$$

$$\mu_{x,T}(\psi) = \frac{1}{N_{\pi^{-1}(x)}(H_i, T)} \sum_{g \in M(K): H_i(gx) < T} \psi(g) \quad \text{for each} \quad x \in \mathbb{N}(K).$$

Note that

$$\mu_T(\psi) = \sum_{x \in \mathbb{N}(K)} N_{\pi^{-1}(x)}(H_i, T) \mu_{x,T}(\psi).$$

Since $\{\mu_T : T \gg 1\}$ is a sequence of probability measures on a compact space $X_i$, it suffices to prove that any convergent subsequence of $\mu_T$, in the weak* topology, has the same limit $\mu_i$. Hence without loss of generality, we may assume that $\mu_T$ is convergent.

Let $\delta > 0$ be as in Proposition 6.11 and let $\beta > 0$ be such that the same proposition holds for all $T > \beta \cdot H_i(x)$. By (6.15) and Theorem 6.2, there exists $\varepsilon > 0$ such that

$$\sum_{x \in \mathbb{N}(K): H_i(x) > \beta^{-1}T} \frac{N_{\pi^{-1}(x)}(H_i, T)}{N(H_i, T)} \leq O(T^{-\varepsilon}).$$

Hence

$$\lim_{T \to \infty} \mu_T(\psi) = \lim_{T \to \infty} \sum_{x \in \mathbb{N}(K): H_i(x) \leq \beta^{-1}T} \frac{N_{\pi^{-1}(x)}(H_i, T)}{N(H_i, T)} \mu_{x,T}(\psi).$$
For \( x \in N(K) \) such that \( H_i(x) \leq \beta^{-1}T \), we deduce from Proposition 6.11 and Theorem 6.2 that
\[
\frac{N_{\pi^{-1}(x)}(H_i, T)}{N(H_i, T)} \leq \frac{c_x}{c_{H_i}} + \theta_x(\log T)^{-\delta},
\]
where \( \theta_x \) comes from the error terms in (6.3) and (6.12), and satisfies \( \sum_{x \in N(K)} \theta_x < \infty \).
Since the sum in (6.19) is majorized by
\[
\sum_{x \in N(K)} \left( \frac{c_x}{c_{H_i}} + \theta_x(\log T)^{-\delta} \right) < \infty,
\]
we can apply the dominated convergence theorem to obtain
\[
\lim_{T \to \infty} \mu_T(\psi) = \sum_{x \in N(K)} \frac{c_x}{c_{H_i}} \left( \lim_{T \to \infty} \mu_{x,T}(\psi) \right).
\]
By Theorem 1.6, applied to \( M \) and the height function \( g \mapsto H_i(gx) \), we have for every \( \psi \in C(X_i) \),
\[
\lim_{T \to \infty} \mu_{x,T}(\psi) = \frac{1}{N_{\pi^{-1}(x)}(H_i, T)} \sum_{g \in M(K): H_i(gx) < T} \psi_x(g) = \int_{X_i} \psi_x \, d\bar{\mu}_{x,i}
\]
where \( \psi_x(g) = \psi(gx) \).
Therefore
\[
\lim_{T \to \infty} \mu_T(\psi) = \sum_{x \in N(K)} \frac{c_x}{c_{H_i}} \cdot \bar{\mu}_{x,i}(\psi_x).
\]

7. Manin’s and Peyre’s conjectures

In this section, we now explain our main results in the context of Manin’s conjecture on the asymptotic number of rational points of bounded height for Fano varieties. Let \( X \) be a smooth projective variety defined over \( K \). For every line bundle class \([L]\) on \( X \) defined over \( K \), there exists an associated height function \( H_L \) on \( X(K) \), unique up to the multiplication by bounded functions, via Weil’s height machine (cf. [51, Theorem B. 3.2]). For example, if \( L \) is a very ample line bundle of \( X \) with a \( K \)-embedding \( \psi_L : X \to \mathbb{P}^N \), then a height function \( H_L \) on \( X(K) \) is defined as
\[
H_L := H \circ \psi_L
\]
for some height function \( H \) on \( \mathbb{P}^N(K) \). We call a pair \( L = (L, H_L) \) a metrized line bundle. Due to the freedom of choosing a height function \( H \) on \( \mathbb{P}^N(K) \), \( H_L \) is not uniquely determined and this is why we use the subscript \( L \) rather than \( L \).

For a metrized ample line bundle \( L = (L, H_L) \) on \( X \) and a subset \( U \) of \( X \), set
\[
N_{U}(L, T) := \# \{ g \in U \cap X(K) : H_L(g) < T \}.
\]
The goal of Manin’s conjecture is to obtain the asymptotic (as \( T \to \infty \)) of \( N_{U}(L, T) \) for some Zariski open subset \( U \) of \( X \), possibly by passing to a finite extension field of \( K \).
Two important geometric invariants here are:
\[
a_L := \inf \{ a \in \mathbb{Q}_{>0} : a[L] + [K_X] \in \Lambda_{\text{eff}}(X) \} — \text{the Nevanlinna invariant of } L,
\]
\[
b_L := \text{the codimension of the face of } \Lambda_{\text{eff}}(X) \text{ containing } a_L[L] + [K_X] \text{ in its interior}
\]
where \([K_X]\) denotes the canonical line bundle class and \(\Lambda_{\text{eff}}(X)\) denotes the cone of classes of effective line bundles on \(X\).

Now let \(G\) be a connected semisimple adjoint algebraic group defined over \(K\). Let \(X\) denote the projective \(K\)-variety, which is the wonderful compactification of \(G\) constructed by De Concini and Procesi \[18\] and by De Concini and Springer \[19\]. It is shown in \[18\] that \(X\) is a Fano variety.

One way of constructing \(X\) explicitly is to take the Zariski closure of the image of \(G\) in \(\mathbb{P}(M_N)\) under an irreducible faithful representation \(G \to \text{GL}_N\) whose highest weight is regular. A dominant weight \(\chi\) is called regular if \(\chi = \sum_{\alpha \in \Delta} m_\alpha \omega_\alpha\) with all \(m_\alpha > 0\) where \(\{\omega_\alpha : \alpha \in \Delta\}\) is the set of fundamental weights.

The Picard group \(\text{Pic}(X)_K\) is isomorphic to the weight lattice of \(G\). Under this isomorphism, the simple roots \(\alpha\) correspond to the boundary divisors \(D_\alpha\) such that \(X - G = \cup_{\alpha} D_\alpha\), and the Galois action on \(\text{Pic}(X)_K\) corresponds to the twisted Galois action (also called the \(+\)-action, see \[54, 2.3\]) on the weight lattice. Hence, the Picard group \(\text{Pic}(X)\) is freely generated by the line bundles corresponding to the orbits of the fundamental weights under the twisted Galois action. The closed cone \(\Lambda_{\text{eff}}(X)\) of the effective line bundles is the positive cone spanned by \(D_{\Gamma_K, \alpha}, \alpha \in \Delta\), i.e.,

\[
\Lambda_{\text{eff}}(X) = \oplus_{\alpha \in \Delta} \mathbb{R}_{\geq 0} [D_{\Gamma_K, \alpha}]
\]

where the sum is taken over the \(\Gamma_K\)-orbits \(\Gamma_K, \alpha\) in the set \(\{\alpha \in \Delta\}\) of simple roots and \(D_{\Gamma_K, \alpha} := \sum_{\delta \in \Gamma_K, \alpha} D_\delta\). Moreover any ample line bundle class \([L]\) of \(X\) over \(K\) corresponds to a regular dominant weight in such a way that if \([L'] := m[L]\) corresponds to \(\chi \in X^+(\mathbb{T})\) for \(m \in \mathbb{N}\), the restriction of \(H_{L'}\) to \(G(K)\) coincides with a height function \(H_{L'}\) with respect to the irreducible representation \(\iota\) defined over \(K\) with the highest weight \(\lambda\) and \(a_L = a, b_L = b\) (cf. \[48, \text{Proposition 6.3}\]). In particular, \(H_{L'}\) has a natural extension to \(G(\mathbb{A})\). We refer to \[9, \text{Ch. 6}\] for a more detailed account on the wonderful compactification, and \[56, 4.1\] and \[48, \text{Section 6}\] on metrized line bundles.

Therefore the following theorem, conjectured by Manin, follows from Theorem 1.2.

**Theorem 7.1.** Let \(X\) be the wonderful compactification of a connected adjoint semisimple \(K\)-group \(G\), and \(L = (L, H_{L})\) a metrized ample line bundle on \(X\). Then there exist \(c_L > 0\) and \(\delta > 0\) such that

\[
N_G(L, T) = c_L \cdot T^{a_L} (\log T)^{b_L - 1} (1 + O((\log T)^{-\delta})).
\]

In order to describe the distribution of rational points, we construct a finite measure \(\tau_L\) on \(X(\mathbb{A})\) first for each saturated ample line bundle \(L\) and then for any ample line bundle \(L\).

**Definition 7.2.** We call an ample line bundle \(L\) on \(X\) saturated if the representation defined by the corresponding dominant weight is saturated.

We note that if \(G\) is \(K\)-simple, every ample line bundle is saturated, and that the anticanonical line bundle \(-K_X\) is always saturated for any \(G\). Batyrev and Tschinkel introduced
the notion of a strongly saturated line bundle in [4]: A line bundle \( \mathcal{L} \) is called \textit{strongly saturated} if for any Zariski open dense subset \( U \) of \( X \),

\[
lim_{T \to \infty} \frac{N_U(\mathcal{L}, T)}{N_G(\mathcal{L}, T)} = 1. 
\]

**Lemma 7.4.** — A strongly saturated (see (7.3)) ample line bundle \( L \) is saturated.

**Proof.** — Suppose not. Then by Theorem 4.13, there exists a connected normal \( K \)-subgroup \( M \) of \( G \) such that \( \iota_M \) is saturated and the volume of \( B_T \cap M(\mathbb{A}) \) is of order \( T^{a_L}(\log T)^{6L-1} \). By Theorem 1.6, \( \#B_T \cap M(K) \) has the order of \( T^{a_L}(\log T)^{6L-1} \). This contradicts to the assumption that \( L \) is strongly saturated.

**Lemma 7.5.** — Let \( \mathcal{L} \) and \( \mathcal{L}' \) be metrizations of a saturated line bundle \( L \) and \( (B_T, W_f) \), and \( (B'_T, W'_f) \) be defined as above with respect to \( \mathcal{L} \) and \( \mathcal{L}' \) respectively. Then

\[
\lim_{T \to \infty} \frac{\tau_{W_f}(B_T \cap G_{W_f})}{\tau_{W'_f}(B'_T \cap G_{W'_f})} = \frac{\tau(\mathcal{L}(G(\mathbb{A})))}{\tau(\mathcal{L}'(G(\mathbb{A})))}.
\]

**Proof.** — Let \( V_f = W_f \cap W'_f \). By Proposition 4.16, it suffices to show that

\[
\lim_{T \to \infty} \frac{\tau(B_T \cap G_{V_f})}{\tau(B'_T \cap G_{V_f})} = \frac{\tau(\mathcal{L}(G(\mathbb{A})))}{\tau(\mathcal{L}'(G(\mathbb{A})))}.
\]

Let \( S \) be a finite set such that \( H_{\mathcal{L}} \) and \( H_{\mathcal{L}'} \) are equal on \( G^S \). If we set \( H_{\mathcal{L}, S} = H_{\mathcal{L}}|_{G_S} \), then it follows from (7.10) and Theorem 4.3 that

\[
\frac{\tau(\mathcal{L}(G(\mathbb{A})))}{\tau(\mathcal{L}'(G(\mathbb{A})))} = \frac{\int_{G_S} H_{\mathcal{L}, S}(g)^{-a_L} \gamma_S(g) d\tau_S}{\int_{G_S} H_{\mathcal{L}', S}(g)^{-a_L} \gamma_S(g) d\tau_S}.
\]

Theorem 4.13 with \( S = \emptyset \) and (7.7) imply that the both sides of (7.6) stay the same when \( H_{\mathcal{L}, S} \) and \( H_{\mathcal{L}', S} \) are replaced by constant multiples. Hence, we can assume that

\[
H_{\mathcal{L}, S}(e) = H_{\mathcal{L}', S}(e) = 1.
\]

As in the proof of Lemma 4.27, we obtain

\[
\tau(B_T \cap G_{V_f}) = \int_{g \in G_S} \tau(\mathcal{L}(B_T H_{\mathcal{L}, S}(g)^{-1} \cap s_g G_{V_f} \cap G^S)) d\tau_S(g)
\sim \left( \int_{g \in G_S} H_{\mathcal{L}, S}(g)^{-a_L} \gamma_S(g) d\tau_S(g) \right) \cdot \tau(\mathcal{L}(B_T \cap G_{V_f} \cap G^S)).
\]

Similarly,

\[
\tau(B'_T \cap G_{V_f}) \sim \left( \int_{g \in G_S} H_{\mathcal{L}', S}(g)^{-a_L} \gamma_S(g) d\tau_S(g) \right) \cdot \tau(\mathcal{L}'(B'_T \cap G_{V_f} \cap G^S)).
\]

Since by (7.8),

\[
B_T \cap G^S = B'_T \cap G^S,
\]
this finishes the proof. \( \square \)
Now we define a finite measure $\tau_L$ on $X$ which describes the asymptotic distribution of rational points with respect to a metrized ample line bundle $L = (L, H_L)$. If $L$ is saturated, we set $\tau_L$ to be $\tilde{\tau}_L$ defined in the following proposition. Let $W_L$ denote the maximal compact open subgroup of $G(\mathbb{A}_f)$ under which $H_L$ is $b$-invariant.

**Proposition 7.9.** — For any metrized ample line bundle $L = (L, H_L)$, there exists a unique finite measure $\tilde{\tau}_L$ on $X(\mathbb{A})$ such that for all $\psi \in C(X(\mathbb{A}))$ invariant under a co-finite subgroup of $W_L$,

$$
\tilde{\tau}_L(\psi) = d_K^{-\dim(X)/2} \sum_{\chi \in \Lambda_M} \left( \lim_{s \to a_L} (s-a_L)^{b_L} \int_{G(\mathbb{A})} H_L(g)^{-s} \chi(g) \psi(g) \, d\tau(g) \right).
$$

**Proof.** — Let $\iota$ be the representation with highest weight given by the regular dominant weight corresponding to $L$. Then $X(\mathbb{A}) = X_1$. By Theorem 4.18 it suffices to set

$$
\tilde{\tau}_L = d_K^{-\dim(X)/2} \cdot \gamma_{W_L}(e) \cdot \tilde{\mu}.
$$

For a general ample line bundle $L$, the variety $X$ has an *asymptotic arithmetic $\mathcal{L}$-fibration* in the sense of [4]. By the results in section 6, there exist a connected semisimple $K$-group $\text{N}$ and a surjective $K$-homomorphism $\pi : G \to \text{N}$ such that for each $x \in \text{N}(K)$, there exist a finite measure $\tilde{\tau}_{x,\mathcal{L}}$ on $X(\mathbb{A})$ supported on $\pi^{-1}(x)(\mathbb{A})$ satisfying the following:

1. for any $\psi \in C(X(\mathbb{A}))$ invariant under a compact open subgroup of $G(\mathbb{A}_f)$,

$$
\tilde{\tau}_{x,\mathcal{L}}(\psi) = d_K^{-\dim(X_M)/2} \sum_{\chi \in \Lambda_M} \left( \lim_{s \to a_L} (s-a_L)^{b_L} \int_{\text{M}(\mathbb{A})} H_M(gx)^{-s} \chi(g) \psi(gx) \, d\tau_M(g) \right)
$$

where $M = \pi^{-1}(e)$, $\tau_M$ is the Haar measure on $M(\mathbb{A})$ with $\tau_M(M(K) \cap M(\mathbb{A})) = 1$, $\Lambda_M$ is defined in the same way as $\Lambda$ for $M$ and $X_M$ is the closure of $M$ in $X$;

2. there exists $c_x > 0$ such that as $T \to \infty$,

$$
N_{\pi^{-1}(x)}(\mathcal{L}, T) \sim c_x \cdot T^{b_L} \cdot (\log T)^{b_L-1}.
$$

By Lemma 7.5, there exists $c_L > 0$ (independent of metrization) such that $c_x = c_L \cdot \tilde{\tau}_{x,\mathcal{L}}(X(\mathbb{A}))$ for each $x \in \text{N}(K)$. Theorem 6.2 implies that

$$
\sum_{x \in \text{N}(K)} \tilde{\tau}_{x,\mathcal{L}}(X(\mathbb{A})) < \infty
$$

and that the following defines a finite measure on $X$ satisfying Theorem 7.11:

$$
\tau_\mathcal{L} := \sum_{x \in \text{N}(K)} \tau_{x,\mathcal{L}}.
$$

**Theorem 7.11.** — For any metrized ample line bundle $\mathcal{L} = (L, H_\mathcal{L})$ on $X$, and for any $\psi \in C(X(\mathbb{A}))$,

$$
\lim_{T \to \infty} \frac{1}{N_G(\mathcal{L}, T)} \sum_{g \in G(\mathbb{A}) : H_{\mathcal{L}}(g) < T} \psi(g) = \frac{1}{\tau_\mathcal{L}(X(\mathbb{A}))} \int_{X(\mathbb{A})} \psi \, d\tau_\mathcal{L}.
$$

Moreover, if $L$ is saturated and $c_\mathcal{L}$ is as in Theorem 7.1, the ratio $\frac{c_\mathcal{L}}{\tau_\mathcal{L}(X(\mathbb{A}))}$ is independent of the metrization $H_\mathcal{L}$.
Remark 7.1. – Peyre [41] defined the Tamagawa measure $\tau_{-K_X}$ on $X(\mathbb{A})$ associated with the anti-canonical metrized line bundle $-K_X = (-K_X, H_{-K_X})$:

$$\tau_{-K_X} := c_0 \cdot \lim_{s \to 1^+} (s - 1)^{\text{rank}(\text{Pic}(X))} \left( \prod_{v \in R - S} L_v(s, \text{Pic}(X)) \right) \cdot H_{-K_X}(g)^{-1} d\tau(g)$$

where $S \subset R$ is a finite subset of places with bad reduction, and $c_0 = \sqrt{d_K} \cdot \prod_{v \in R - S} L_v(1, \text{Pic}(X))^{-1}$ with $d_K$ the discriminant of $K$.

Note that $a_{-K_X} = 1$, $b_{-K_X} = \text{rank}(\text{Pic}(X))$, and

$$\lim_{s \to 1^+} (s - 1)^{\text{rank}(\text{Pic}(X))} \int_{G(\mathbb{A})} H_{-K_X}(g)^{-s} \chi(g) d\tau(g) = 0$$

for all $\chi \neq 1$. Hence for $L = -K_X$, (7.10) gives Peyre’s measure $\tau_{-K_X}$. An analog of Peyre’s measure for general line bundles was also introduced in [4], but the measure $\tau_L$ seems to be different, in general, from the measure defined in [4].
