SCATTERED HOMOCLINICS TO A CLASS OF TIME-RECURRENT HAMILTONIAN SYSTEMS

GREGORY S. SPRADLIN

Abstract. A second-order Hamiltonian system with time recurrence is studied. The recurrence condition is weaker than almost periodicity. The existence is proven of an infinite family of solutions homoclinic to zero whose support is spread out over the real line.

1. Introduction

In this paper we study a second-order Hamiltonian system with a time recurrence property that is weaker than almost periodicity. The zero function is a hyperbolic fixed point solution. We prove the existence of infinitely many solutions homoclinic to zero, that is, solutions $v$ with $v(t) \to 0$ and $v'(t) \to 0$ as $t \to \pm \infty$. The solutions are scattered infinitely far to the left and to the right along the real line.

The Hamiltonian system has the form

$$-u'' + u = W'(t, u),$$

where $u : \mathbb{R} \to \mathbb{R}^N$, $W \in C^1(\mathbb{R} \times \mathbb{R}^N, \mathbb{R})$, $W'(t, u) \equiv \nabla_q W(t, q) \equiv \langle \partial W/\partial q_1, \ldots, \partial W/\partial q_N \rangle$, and $W(t, u)$ is a “superquadratic” function of $u$, and satisfies a time recurrence property in $t$ that is weaker than almost periodicity. To be precise, let $N \in \mathbb{N}^+$ and let $W$ satisfy

$(W_1)$ $W \in C^1(\mathbb{R} \times \mathbb{R}^N, \mathbb{R})$ and $W'(t, \cdot)$ is locally Lipschitz, uniformly in $t$.

$(W_2)$ $W(t, 0) = 0$ for all $t \in \mathbb{R}$, $|W'(t, q)|/|q| \to 0$ as $|q| \to 0$, uniformly in $t$.

$(W_3)$ There exists $\mu > 2$ with $W'(t, q) \cdot q \geq \mu W(t, q) \geq 0$ for all $(t, q) \in \mathbb{R} \times \mathbb{R}^N$. There exists $(\bar{t}, \bar{q}) \in \mathbb{R} \times (\mathbb{R}^N \setminus \{0\})$ such that $\frac{1}{2}|\bar{q}|^2 - W(\bar{t}, \bar{q}) \leq 0$.

$(W_4)$ There exists a sequence $(t_m) \subset \mathbb{R}^+$ such that $W'(t - t_m, q) \to W'(t, q)$ as $m \to \infty$ for all $t \in \mathbb{R}$, $q \in \mathbb{R}^N$.

These assumptions are the same as in [2]. The reader is referred to that paper for more background on the equation. Both [2] and this paper prove that (1.1) has infinitely many solutions homoclinic to zero. Both papers prove a stronger result than [5]. In [5], $W$ is assumed to be in “factored” form $\alpha(t)G(q)$, with $\alpha$ almost periodic in $t$, which is a stronger assumption than $(W_4)$. Also, [5] proves the existence of only one nontrivial solution homoclinic to zero.

Keywords and phrases. Mountain pass theorem, Palais-Smale sequences, almost periodic, Hamiltonian system.

In [2], it is proven that the set of solutions of (1.1) homoclinic to zero is uncountable, or there exists an infinite family of “multibump” solutions, which resemble the sums of translates of a particular homoclinic solution. This is done by assuming the set of solutions homoclinic to zero to be countable, then finding one critical point of the corresponding functional with local “mountain-pass” geometry, then “gluing” that critical point to translates of itself. This paper also proves that (1.1) has infinitely many solutions homoclinic to zero, relying on the recurrence property of W rather than a multibump construction. We obtain the following result, which is independent of the very strong result of [2].

**Theorem 1.1.** If W satisfies (W1)-(W4), then there exist \( r_0 > 0 \), sequences \((t^+_m)\) and \((t^-_m)\) with \( t^+_m \to \infty \) and \( t^-_m \to -\infty \) as \( m \to \infty \), and sequences of solutions \((v^+_m)\), \((v^-_m)\) of (1.1) homoclinic to zero with \( |v^+_m(t^+_m)| > r_0 \) and \( |v^-_m(t^-_m)| > r_0 \) for all \( m \).

The proof of the theorem is shorter and simpler than that of [2], but does not describe the structure of solutions in such detail.

This paper is organized as follows: In Section 2 the variational setting of the problem is set up, the theorem is proven for a special case, and some technical lemmas are proven. Section 3 completes the proof for the more difficult case.

2. **Variational setting and preliminary lemmas**

Define \( E = W^{1,2}(\mathbb{R}, \mathbb{R}^N) \). Let \((\cdot, \cdot)\) be the standard inner product on \( E \), that is, \((u, w) = \int_{\mathbb{R}} u' \cdot w' + u \cdot w \, dt\), with corresponding norm \( \|u\|^2 = (u, u) \). Define the functional \( I : E \to \mathbb{R} \) by \( I(u) = \frac{1}{2} \|u\|^2 - \int_{\mathbb{R}} W(t, u) \, dt \).

By (W1)-(W2), \( I \) is Fréchet differentiable, with \( I'(u)w = (u, w) - \int_{\mathbb{R}} W'(t, u) \cdot w \, dt \), and \( I' \) is locally Lipschitz. Critical points of \( I \) correspond exactly to solutions of (1.1) homoclinic to zero. By (W2), \( I(u) = \frac{1}{2} \|u\|^2 - o(\|u\|^2) \) as \( \|u\| \to 0 \). By (W3), there exists \( u_0 \in E \) with \( I(u_0) < 0 \). Therefore, \( I \) satisfies the geometric conditions of the Mountain Pass Theorem of Ambrosetti and Rabinowitz [3]. That is, the set of “mountain-pass curves”

\[
\Gamma = \{ \gamma \in C([0,1], E) \mid \gamma(0) = 0, I(\gamma(1)) < 0 \}
\]

is nonempty, and the mountain-pass value

\[
c = \inf_{\gamma \in \Gamma} \max_{[0,1]} I(\gamma(t))
\]

is positive. \( I \) does not satisfy the Palais-Smale condition, however, so the Mountain Pass Theorem cannot be applied. The Palais-Smale condition holds if any sequence \((u_m) \subset E \) with \( I'(u_m) \) convergent and \( I'(u_m) \to 0 \) has a convergent subsequence. \( I \) does not satisfy the Palais-Smale condition, because the domain \( \mathbb{R} \) is unbounded. Even if, for example, \( W \) is periodic in \( t \), the Palais-Smale condition fails even modulo the periodicity: suppose \( W \) is 1-periodic in \( t \), and \( v \) is a nontrivial solution of (1.1) homoclinic to zero. Define the translation operator \( \tau \) as follows: for a function \( u \) defined on \( \mathbb{R} \) and real \( a \), let \( \sigma_a u \) be \( u \) shifted \( a \) units to the right; that is, \((\sigma_a u)(t) = u(t - a)\). Then the sequence \((v + \sigma_a v)\) satisfies \( I(v + \sigma_a v) \to 2I(v) \) and \( I'(v + \sigma_a v) \to 0 \) as \( n \to \infty \), but the sequence has no convergent subsequence, even if we are allowed to shift functions by integer multiples of a period.

With \( \mu \) as in (W3), define

\[
B = 1 + \frac{200c\mu}{\mu - 2}
\]

Let \( r_0 > 0 \) be small enough that

\[
|W'(t, q)| \leq \frac{1}{64}|q|
\]

for all \((t, q) \in \mathbb{R} \times \mathbb{R}^N \) with \( |q| \leq r_0 \). This is possible by (W2). Finally, let \( M \) be an integer with

\[
M > \frac{4B^2}{r_0^2}
\]
Define $T : \mathbb{R} \to \mathbb{R}^+$ by
\[ T(t) = \inf \{ \| I'(u) \| \mid \| u \| \leq B, \| u \|_{L^\infty(t-M,t+M)} \geq r_0 \}. \] (2.6)
Then one of the following alternatives holds:
\begin{align*}
\text{Case I: } & T(t) = 0 \text{ for all } t \in \mathbb{R}, \text{ or} \\
\text{Case II: } & T(\bar{t}) > 0 \text{ for some } \bar{t} \in \mathbb{R}. \quad (2.7)
\end{align*}
Suppose Case I holds. The precise values of $r_0$, $B$, and $M$ are unimportant in this case, only that they are positive. Let $t_0 \in \mathbb{R}$ be arbitrary. There exists a sequence $(u_m)$ with $\| I'(u_m) \| \to 0$ as $m \to \infty$, $\| u_m \| \leq B$ for all $m$, and $\| u \|_{L^\infty(t_0-M,t_0+M)} \geq r_0$ for all $m$. Along a subsequence (also denoted $(u_m)$), $(u_m)$ converges weakly and in $L^\infty_{loc}(\mathbb{R}, \mathbb{R}^N)$ to $\bar{u}$ with $\| \bar{u} \| \leq B$ and $\| \bar{u} \|_{L^\infty(t_0-M,t_0+M)} \geq r_0$. By arguments of [1], or arguments from Lemma 2.1 of this paper, $\bar{u}$ is a critical point of $I$, hence a solution of (1.1). $t_0$ was arbitrary, so Theorem 1.1 holds.

The rest of this paper is devoted to Case II. First, if $T$ is positive somewhere, it is bounded away from zero on a sequence of $t$'s that approaches infinity:

**Lemma 2.1.** If $T(\bar{t}) > 0$, then there exist $\delta > 0$ and $K \in \mathbb{N}$ with $m \geq K \Rightarrow T(\bar{t} + t_m) > \delta$.

**Proof.** Suppose otherwise, that there exist $\bar{t} \in \mathbb{R}$ with $T(\bar{t}) > 0$ and a subsequence of $(t_m)$ (also denoted $(t_m)$) with $T(\bar{t} + t_m) \to 0$. Pick a sequence $(u_m) \subset \mathcal{E}$ with $\| u_m \| \leq B$ and
\[ \| u_m \|_{L^\infty(\bar{t} + t_m - M, \bar{t} + t_m + M)} \geq r_0 \] (2.8)
for all $m$, and $\| I'(u_m) \| \to 0$. ($\tau_{t_m} u_m$) converges weakly and in $L^\infty_{loc}(\mathbb{R}, \mathbb{R}^N)$ along a subsequence (also denoted $(\tau_{-t_m} u_m)$) to $\bar{u} \in \mathcal{E}$ with $\| \bar{u} \| \leq B$ and
\[ \| \bar{u} \|_{L^\infty(\bar{t} - M, \bar{t} + M)} \geq r_0. \] (2.9)
We will show that $I'(\bar{u}) = 0$, contradicting the fact that $T(\bar{t}) > 0$. Let $w \in \mathcal{E}$ be arbitrary with $\| w \| = 1$. Then
\[ I'(u_m)(\tau_{t_m} w) - I'(\bar{u})w = \langle u_m, \tau_{t_m} w \rangle - \langle \bar{u}, w \rangle + \int_\mathbb{R} W'(t, \bar{u})w(t) \, dt - \int_\mathbb{R} W'(t, u_m)\tau_{t_m} w(t) \, dt \]
\[ = (\tau_{-t_m} u_m, w) - (\bar{u}, w) + \int_\mathbb{R} W'(t, \bar{u})w(t) - W'(t + t_m, u_m(t + t_m))w(t) \, dt \]
\[ = (\tau_{-t_m} u_m - \bar{u}, w) + \int_\mathbb{R} (W'(t, \bar{u}) - W'(t + t_m, u_m(t + t_m)))w(t) \, dt. \] (2.10)
$\tau_{-t_m} u_m \to \bar{u}$ weakly, so the inner product at the end of (2.10) goes to 0 as $m \to \infty$. Now let $\epsilon > 0$. Let $R > 0$ with
\[ \int_{\| t \| > R} |w|^2 \, dt < \epsilon^2. \] (11.1)
Since $\tau_{-t_m} u_m \to \bar{u}$ in $L^\infty(\mathbb{R}, \mathbb{R}^N)$, (W1) and (W4) imply that
\[ (W'(t, \bar{u})(t)) - W'(t + t_m, u_m(t + t_m))w(t) \to 0 \] (2.12)
as $m \to \infty$ for all $t \in \mathbb{R}$. Since $(u_m)$ is bounded in $L^\infty(\mathbb{R}, \mathbb{R}^N)$ and $w$ is continuous, there exists $C_2 > 0$ with
\[ |(W'(t, \bar{u})(t)) - W'(t + t_m, u_m(t + t_m))w(t)| \leq C_2 \] (2.13)
for all $t \in \mathbb{R}, m \in \mathbb{N}$. By the Dominated Convergence Theorem,
\[ \int_{-R}^R (W'(t, \bar{u})(t)) - W'(t + t_m, u_m(t + t_m))w(t) \to 0 \] (2.14)
as $m \to \infty$. By $(W_2)$, since $(u_m)$ is bounded in $L^\infty(\mathbb{R}, \mathbb{R}^N)$, there exists $C > 0$ with
\[
|W'(t, \bar{u}(t))| \leq C|\bar{u}(t)| \text{ and } |W'(t, u_m(t))| \leq C|u_m(t)|
\] (2.15) for all $t \in \mathbb{R}$ and $m \in \mathbb{N}$. By the Cauchy-Schwarz inequality, for all $m$,
\[
\int_{|t| \geq R} (W'(t, \bar{u}(t)) - W'(t + t_m, u_m(t + t_m)))w(t) \, dt \\
\leq \left( \int_{|t| \geq R} |W'(t, \bar{u}(t)) - W'(t + t_m, u_m(t + t_m))|^2 \, dt \right)^{\frac{1}{2}} \left( \int_{|t| \geq R} |w|^2 \, dt \right)^{\frac{1}{2}} \\
\leq \epsilon \left( \int_{|t| \geq R} |C\bar{u}(t) + Cu_m(t + t_m)|^2 \, dt \right)^{\frac{1}{2}} \\
\leq 2C\epsilon \left( \int_{\mathbb{R}} |\bar{u}(t)|^2 + |u_m(t + t_m)|^2 \right)^{\frac{1}{2}} \\
\leq 4BC\epsilon.
\] (2.16) Thus, by (2.14) and (2.16),
\[
\limsup_{m \to \infty} |I'(u_m)(\tau_m, w) - I'(\bar{u})w| \leq 4BC\epsilon.
\] (2.17) $\epsilon > 0$ was arbitrary, so
\[
\lim_{m \to \infty} |I'(u_m)(\tau_m, w) - I'(\bar{u})w| = 0.
\] (2.18) Since $I'(u_m)(\tau_m, w) \to 0$, $I'(\bar{u})w = 0$. $w \in E$ was arbitrary with $\|w\| = 1$, so $I'(\bar{u}) = 0$. This contradicts the assumption that $T(t) > 0$. Lemma 2.1 is proven. \qed

For $u \in E$, define $\nabla I(u)$ to be the gradient of $u$, satisfying $\langle \nabla I(u), w \rangle = I'(u)w$ for all $w \in E$. Let $\varphi : E \to [0, 1]$ be locally Lipschitz continuous with $\varphi(u) = 1$ if $I(u) \geq -1$ and $\varphi(u) = 0$ if $I(u) \leq -2$. Define the gradient vector flow $\eta$ to be the solution of the initial value problem
\[
\frac{d\eta}{ds} = -\varphi(u)\nabla I(u), \quad \eta(0, u) = u.
\] (2.19) $\eta$ is well-defined on $\mathbb{R}^+ \times E$ (see [4]). We will need several lemmas about $\eta$. First, for the functions $u$ that we will be most interested in, there is an a priori bound on $\eta(s, u)$ for $s \geq 0$:

Lemma 2.2. If $u \in E$ with $I(u) \leq 2c$ and $\lim_{s \to -\infty} I(\eta(s, u)) > 0$, then $\|u\| \leq B$, where $B$ is from (2.3).

Proof. For all $w \in E$ with $I(w) \leq 2c$ and $\|w\| \geq B/2$,
\[
\|I'(w)\| \geq - \frac{I'(w)w}{\|w\|} = -\frac{\|w\|^2 + \int_\mathbb{R} W'(t, w)w \, dt}{\|w\|} \\
\geq -\frac{\|w\|^2 + \mu \int_\mathbb{R} W(t, w) \, dt}{\|w\|} = -\frac{\|w\|^2 + \frac{\mu}{2} \|w\|^2 - \mu I(w)}{\|w\|} \\
\geq \left( \frac{\mu}{2} - 1 \right) \|w\| - \frac{2c\mu}{\|w\|} \geq \left( \frac{1}{4} \left( \frac{\mu}{2} - 1 \right) B \right.
\] (2.20) by $(W_3)$ and the definition of $B$ (2.3). Now let $u \in E$ with $I(u) \leq 2c$, $\lim_{s \to -\infty} I(s, u) > 0$, and $\|u\| \geq B$. We will arrive at a contradiction. Define $\eta(s) \equiv \eta(s, u)$. If $\|\eta(s)\| \geq B/2$ for all $s \geq 0$, then by (2.20),
\[
\frac{d}{ds} I(\eta(s)) = -\|I'(\eta(s))\|^2 \leq -\frac{1}{16} \left( \frac{\mu}{2} - 1 \right)^2 B^2
\] for all $s > 0$, so $I(\eta(s)) \to -\infty$ as $s \to \infty$, contradicting our
assumption on \( u \). Therefore there exists \( s > 0 \) with \( \| \eta(s) \| \leq B/2 \), and we may pick \( 0 < s_1 < s_2 \) with \( \| \eta(s_1) \| = B_1, \| \eta(s_2) \| = B_1/2, \) and \( \| \eta(s) \| \in (B_1/2, B) \) for all \( s \in (s_1, s_2) \). Then

\[
2c \geq I(\eta(s_1)) - I(\eta(s_2)) = - \int_{s_1}^{s_2} \frac{dI}{ds}(\eta) \, ds
= \int_{s_1}^{s_2} \| I'(\eta) \|^2 \, ds \geq \frac{1}{16} (s_2 - s_1) \left( \frac{B}{2} - 1 \right)^2 B^2.
\] (2.21)

On the other hand, the Cauchy-Schwarz Inequality yields

\[
B/2 \leq \| \eta(s_1) - \eta(s_2) \| \leq \left( \int_{s_1}^{s_2} \frac{d\eta}{ds} \, ds \right) \leq \int_{s_1}^{s_2} \frac{d\eta}{ds} \, ds \leq \sqrt{s_2 - s_1} \left( \int_{s_1}^{s_2} \left( \frac{d\eta}{ds} \right)^2 \, ds \right)^{1/2} \leq \sqrt{2c} \sqrt{s_2 - s_1}.
\] (2.22)

Therefore

\[
\frac{128c}{B^2(\mu - 2)} \geq s_2 - s_1 \geq \frac{B^2}{8c}, \quad B^4 \leq \frac{1024c^2}{(\mu - 2)^2},
\] (2.23)

contradicting the definition of \( B \) ((2.3)). Lemma 2.2 is proven. \( \square \)

Lemma 2.2 is needed for the following:

**Lemma 2.3.** There exists \( a > 0 \) such that if \( I(u) \leq 2c \) and \( \lim_{s \to \infty} I(\eta(s, u)) > 0 \), then

\[
\| I'(\eta(s, u)) \|^2 \leq a(I(u) - \lim_{s \to \infty} I(\eta(s, u)))
\] (2.24)

for all \( s \geq 0 \).

**Proof.** If \( I'(u) = 0 \), then both sides of the inequality (2.24) are zero, so assume \( I'(u) \neq 0 \). Define \( \eta \equiv \eta(s) \equiv (s, u) \). By Lemma 2.2, \( \| \eta(s) \| \leq B \) for all \( s \geq 0 \). \( I' \) is Lipschitz on bounded subsets of \( E \), so there exists \( \beta > 0 \) with \( \| I'(w) - I'(y) \| \leq \beta \| w - y \| \) for all \( w, y \in E \) with \( \| w \|, \| y \| \leq B \). Since \( I'(0) = 0 \), \( \| I'(w) \| \leq \beta B \) for all \( w \in E \) with \( \| w \| \leq B \). Suppose that for some \( s^* \),

\[
\| I'(\eta(s^*)) \| > A_1 \equiv 3 \sqrt{B^2 I(u) - \lim_{s \to \infty} I(\eta(s, u))}.
\] (2.25)

This will lead to a contradiction. Let

\[
A_2 = \frac{A_1}{2 \beta^2 B}
\] (2.26)

Then for all \( s \in [s^*, s^* + A_2] \),

\[
\| \eta(s) - \eta(s^*) \| = \left\| \int_{s^*}^s \frac{d\eta}{ds} \, ds \right\| \leq \int_{s^*}^s \left\| \frac{d\eta}{ds} \right\| \, ds = \int_{s^*}^s \| I'(\eta) \| \, ds \leq \beta B A_2.
\] (2.27)

So for all \( s \in [s^*, s^* + A_2] \),

\[
\| I'(\eta(s)) \| \geq \| I'(\eta(s^*)) \| - \| I'(\eta(s)) - I'(\eta(s^*)) \|
\geq \| I'(\eta(s^*)) \| - \beta \| \eta(s^*) - \eta(s) \|
\geq \| I'(\eta(s^*)) \| - \beta^2 B A_2 \geq \frac{1}{2} A_1.
\] (2.28)
So
\[
I(\eta(s^* + A_2)) = I(\eta(s^*)) + (I(\eta(s^* + A_2)) - I(\eta(s^*)))
\]
\[
= I(\eta(s^*)) + \int_{s^* + A_2}^{s^* + A_2} \frac{d}{ds} I(\eta(s)) \, ds
\]
\[
= I(\eta(s^*)) - \int_{s^*}^{s^* + A_2} \| I'(\eta(s)) \|^2 \, ds
\]
\[
\leq I(u) - \int_{s^*}^{s^* + A_2} (A_1/2)^2 \, ds
\]
\[
= I(u) - \frac{1}{4} A_1^2 A_2 = I(u) - \frac{A_1^2}{8B\beta^2}
\]
\[
\leq I(u) - 2(I(u) - \lim_{s \to \infty} I(\eta(s)))
\]
\[
< I(u) - (I(u) - \lim_{s \to \infty} I(\eta(s))) = \lim_{s \to \infty} I(\eta(s)).
\]
This is impossible. The assumption is false, and the lemma is proven, with \(a = 27B\beta^2\). □

Several more lemmas are needed. First, two simple lemmas regarding cutoff functions:

**Lemma 2.4.** Let \(u \in E\) and \(\varphi \in W^{1,\infty}(\mathbb{R}, \mathbb{R})\) with \(0 \leq \varphi(t) \leq 1\) for all \(t \in \mathbb{R}\) and \(|\varphi'| \leq d\) almost everywhere. Then \(\|\varphi u\| \leq (1 + d)\|u\|\).

*Proof.*
\[
\|\varphi u\|^2 = \int_{\mathbb{R}} \varphi^2 |u|^2 + |\varphi' u + \varphi u'|^2 \, dt
\]
\[
\leq \int_{\mathbb{R}} |u|^2 + |\varphi'|^2 |u|^2 + 2|\varphi'| |\varphi| |u| |u'| + \varphi^2 |u'|^2 \, dt
\]
\[
\leq \int_{\mathbb{R}} |u|^2 + d^2 |u|^2 + 2d |u| |u'| + |u'|^2 \, dt
\]
\[
\leq \int_{\mathbb{R}} |u|^2 + d^2 |u|^2 + d |u|^2 + d |u'|^2 + |u'|^2 \, dt
\]
\[
\leq (1 + d + d^2) \int_{\mathbb{R}} |u|^2 + |u'|^2 \, dt \leq (1 + d)^2 \|u\|^2.
\]
□

**Lemma 2.5.** Let \(u, w \in E\) and \(\varphi \in W^{1,\infty}(\mathbb{R}, \mathbb{R})\) with \(0 \leq \varphi(t) \leq 1\) for all \(t \in \mathbb{R}\) and \(|\varphi'| \leq d\) almost everywhere, then \(|(\varphi u, w) - (u, \varphi w)| \leq d\|u\|\|w\|\).

*Proof.*
\[
|(\varphi u, w) - (u, \varphi w)| = \left| \int_{\mathbb{R}} (\varphi u)' \cdot w' - u' \cdot (\varphi w)' \, dt \right|
\]
\[
= \left| \int_{\mathbb{R}} (\varphi' u + \varphi u') \cdot w' - u' \cdot (\varphi' w + \varphi w') \, dt \right|
\]
\[
= \left| \int_{\mathbb{R}} \varphi' (u \cdot w' - u' \cdot w) \, dt \right| \leq d \int_{\mathbb{R}} |u||w'| + |u'||w| \, dt \leq d\|u\|\|w\|
\]
by the Cauchy-Schwarz Inequality. □
The next lemma, on the properties of $\nabla I$, is needed for Lemma 2.7. Define $W : E \to E$ by

$$(W(u), w) = \int_{\mathbb{R}} W'(t, u) \cdot w(t) \, dt$$

for all $u, w \in E$. $\nabla I$ has the form $\nabla I(u) = u - W(u)$. Now

**Lemma 2.6.** If $u \in E$ with $\|u\|_{L^\infty(\mathbb{R})} \leq r_0$, then $\|W(u)\|_{L^\infty(\mathbb{R})} \leq r_0/2$.

**Proof.** Let $u \in E$ with $\|u\|_{L^\infty(\mathbb{R})} \leq r_0$. Define $t_{\text{max}} \in \mathbb{R}$ by

$$\|W(u)\|_{W^{1,2}([-4, t_{\text{max}}+4])} = \max \{ \|W(u)\|_{W^{1,2}([-4, t+4])} \mid t \in \mathbb{R} \}$$

and define

$$W_{\text{max}} = \|W(u)\|_{W^{1,2}([-4, t_{\text{max}}+4])}.$$

Define the piecewise linear cutoff function $\varphi$ by

$$\varphi(t) = \begin{cases} 
0; & t \leq t_{\text{max}} - 8 \\
2 - \frac{t - t_{\text{max}}}{8}; & t_{\text{max}} - 8 \leq t \leq t_{\text{max}} - 4 \\
1; & t_{\text{max}} - 4 \leq t \leq t_{\text{max}} + 4 \\
2 - \frac{t - t_{\text{max}}}{8}; & t_{\text{max}} + 4 \leq t \leq t_{\text{max}} + 8 \\
0; & t \geq t_{\text{max}} + 8.
\end{cases}$$

Now

$$W_{\text{max}} \leq \|\varphi W(u)\| = \sup_{\|w\| = 1} (\varphi W(u), w).$$

By Lemmas 2.4 and 2.5,

$$W_{\text{max}} \leq \sup_{\|w\| = 1} (W(u), \varphi w) + \frac{1}{4} \|W(u)\|_{W^{1,2}([-8, t_{\text{max}}+8])}.$$

By the definition of $W_{\text{max}},$

$$\|W(u)\|^2_{W^{1,2}([-8, t_{\text{max}}+8])} = \|W(u)\|^2_{W^{1,2}([-8, t_{\text{max}}])} + \|W(u)\|^2_{W^{1,2}([-8, t_{\text{max}}+8])} \leq 2W_{\text{max}}^2.$$  \hfill (2.30)

So

$$W_{\text{max}} \leq \sup_{\|w\| = 1} \int_{\mathbb{R}} W'(t, u) \cdot \varphi w + \frac{\sqrt{3}}{4} W_{\text{max}},$$

and by (2.4),

$$\frac{1}{2} W_{\text{max}} \leq \sup_{\|w\| = 1} \frac{1}{64} \int_{t_{\text{max}}-8}^{t_{\text{max}}+8} |\varphi||w| \, dt \leq \sup_{\|w\| = 1} \frac{r_0}{64} \int_{t_{\text{max}}-8}^{t_{\text{max}}+8} |w| \, dt$$

$$\leq \sup_{\|w\| = 1} \frac{r_0}{64} \left( \int_{t_{\text{max}}-8}^{t_{\text{max}}+8} |w|^2 \, dt \right)^{\frac{1}{2}} \leq \frac{1}{16} r_0.$$  \hfill (2.31)

So

$$W_{\text{max}} \leq \frac{1}{8} r_0,$$

and for all $t \in \mathbb{R},$

$$\|W(u)\|_{W^{1,2}([-4, t+4])} \leq \frac{1}{8} r_0.$$  \hfill (2.32)
By the embedding $W^{1,2}(0, 8) \subset L^\infty(0, 8)$, with embedding constant
\[
\|u\|_{L^\infty(0, 8)} \leq \frac{1}{1 - e^{-16}}\|u\|_{W^{1,2}(0, 8)} \leq 2\|u\|_{W^{1,2}(0, 8)}
\]
(2.33)
for all $u \in W^{1,2}(0, 8)$ (equality achieved when $u(t) = e^{-t}a$, for any nonzero vector $a \in \mathbb{R}^N$), $|W(t)| < r_0/4$ for all $t \in \mathbb{R}$.

The next lemma is essential to our variational argument. It enables us to conclude that trajectories of the gradient vector flow that are localized along the real line converge to nonzero critical points of $I$.

**Lemma 2.7.** If $u \in E$ with $\eta(s, u) \not= 0$ as $s \to \infty$, then $\|u\|_{L^\infty(\mathbb{R})} \geq r_0$.

**Proof.** We will prove the contrapositive. Let $u \in E$ with $\|u\|_{L^\infty(\mathbb{R})} < r_0$. Then for all $s > 0$, $|\eta(s, u)|_{L^\infty(\mathbb{R})} < r_0$; the proof is indirect – otherwise, let $s' = \min\{s > 0 \mid |\eta(s, u)|_{L^\infty(\mathbb{R})} = r_0\}$. There exists $t' \in \mathbb{R}$ with $|\eta(s', u)(t')| = r_0$ and $\frac{d}{ds}|\eta(s', u)(t')|^2 \geq 0$. But then, by (2.32)–(2.33),
\[
0 \leq \frac{d}{ds}|\eta(s', u)(t')|^2 = -2\eta(s', u)(t') \cdot \nabla I(\eta(s', u))(t')
\]
\[= -2\eta(s', u)(t') \cdot [\eta(s', u)(t') - W(\eta(s', u)(t'))]
\]
\[\leq -2r_0^2 + 2r_0 \left(\frac{r_0}{2}\right) < 0.
\]
This is a contradiction. So $|\eta(s, u)|_{L^\infty(\mathbb{R})} < r_0$ for all $s > 0$. Now define $\phi(s) = |\eta(s, u)|^2$. For all $s > 0$, Lemma 2.6 and (2.4) imply
\[
\frac{d}{ds}\phi(s) = -2(\eta(s, u), \nabla I(\eta(s, u))) = -2I'(\eta(s, u))|\eta(s, u)|^2
\]
\[= -2\|\eta(s, u)\|^2 + 2 \int_\mathbb{R} W'(t, \eta(s, u)) \eta(s, u)
\]
\[\leq -2\|\eta(s, u)\|^2 + 1/32 \int_\mathbb{R} |\eta(s, u)|^2 dt \leq -\|\eta(s, u)\|^2 = -\phi(s),
\]
so $\phi(s) \leq e^{-s}$ for all $s > 0$, and $\phi(s) \to 0$ as $s \to \infty$. □

3. Proof of Theorem 1.1

Theorem 1.1 follows from the following proposition:

**Proposition 3.1.** Let $r_0$ be as in (2.4), and $A > 0$. There exist $t^+ > A$, $t^- < -A$, and homoclinic solutions $v^+$ and $v^-$ to (1.1) with
\[
|v^+(t^+)| > r_0 \text{ and } |v^-(t^-)| > r_0.
\]
(3.1)

**Proof.** we will prove the existence of $v^+$. The proof for $v^-$ is similar. Either Case I or Case II of (2.7) holds. The existence of $v^+$ in Case I is proven in the argument following (2.7), so assume Case II holds. Let $\tilde{t}$ and $\delta$ be as in Case II and Lemma 2.1. Taking a subsequence of $(t_m)$ if necessary, assume that for all $m \in \mathbb{N}$,
\[
(\|u\| \leq B \text{ and } \|u\|_{L^\infty(\tilde{t} + t_m - M, \tilde{t} + t_m + M)} \geq r_0) \Rightarrow \|I'(u)\| > \delta.
\]
(3.2)
Let $m^*$ be large enough so that
\[
\tilde{t} + t_{m^*} - M > A.
\]
(3.3)
Let $a$ be as in Lemma 2.3. Define
\[
\epsilon = \min\left(\frac{\delta^3}{2a^3}, \frac{c^3}{8000B^3a}, \frac{8}{8000B^3a}\right).
\] (3.4)

Let $\gamma_0 \in \Gamma$ with
\[
\max_{\theta \in [0,1]} I(\gamma_0(\theta)) < c + \epsilon/2.
\] (3.5)

Let $\bar{m}$ be large enough so that
\[
\bar{t} + t_m - M > \bar{t} + t_{m^*} + M,
\] (3.6)
\[
I(\tau_m \gamma_0)(1) < 0,
\] (3.7)
\[
I(\tau_m \gamma_0(\theta)) < c + \epsilon \text{ for all } \theta \in [0,1],
\] (3.8)
and
\[
|\tau_m \gamma_0(t)| < r_0 \text{ for all } t < \bar{t} + t_{m^*} + M, \theta \in [0,1].
\] (3.9)

Let $m' > m$ be large enough so that
\[
\bar{t} + t_{m'} - M > \bar{t} + t_m + M,
\] and
\[
|\tau_{m'} \gamma_0(\theta)(t)| < r_0 \text{ for all } t > \bar{t} + t_{m'} - M, \theta \in [0,1].
\] (3.10)

There exists $\bar{\gamma} \in [0,1]$ with
\[
\lim_{s \to \infty} I(\gamma(s, \tau_m \gamma_0(\bar{\gamma}))) \geq c.
\] (3.11)

Define
\[
\bar{u} = \tau_m \gamma_0(\bar{\gamma}).
\] (3.12)

Now
\[
I(\bar{u}) < c + \epsilon, \lim_{s \to \infty} I(\gamma(s, \bar{u})) \geq c, \text{ and } |\bar{u}(t)| < r_0
\] (3.13)
for all $t < \bar{t} + t_{m^*} + M$ and all $t > \bar{t} + t_{m^*} - M$.

By Lemma 2.3 and the definition of $\epsilon$,
\[
\|I'(\gamma(s, \bar{u}))\| < \frac{r_0^2}{16B} \text{ for all } s > 0 \text{ and } \|I'(\gamma(s, \bar{u}))\| \to 0 \text{ as } s \to \infty.
\] (3.14)

By Lemma 2.7, $\|\gamma(s, \bar{u})\|_{L^\infty([0,1])} \geq r_0$ for all $s \geq 0$. We will show that
\[
|\eta(s, \bar{u})(t)| < r_0 \text{ for all } s > 0, t < \bar{t} + t_{m^*} - M \text{ and } t > \bar{t} + t_{m^*} + M.
\] (3.15)

Thus
\[
\|\eta(s, \bar{u})\|_{L^\infty([\bar{t} + t_{m^*} - M, \bar{t} + t_{m^*} + M])} \geq r_0
\] (3.16)
for all $s \geq 0$. Defining $u_n = \eta(n, \bar{u})$, we obtain a Palais-Smale sequence $(u_n)$ with $\|u_n\| \leq B$ and $\|u_n\|_{L^\infty([\bar{t} + t_{m^*} - M, \bar{t} + t_{m^*} + M])} \geq r_0$. $(u_n)$ converges along a subsequence weakly and in $L^\infty_{loc}(\mathbb{R}, \mathbb{R}^N)$ to a critical point $v^+$ of $I$ with
\[
\|v^+\|_{L^\infty(A, \infty)} \geq \|v^+\|_{L^\infty([\bar{t} + t_{m^*} - M, \bar{t} + t_{m^*} + M])} \geq r_0,
\] (3.17)
proving Proposition 3.1 and Theorem 1.1.

Let us now prove that $|\eta(s, \bar{u})(t)| < r_0$ for all $s \geq 0, t < \bar{t} + t_{m^*} - M$. The proof for $t > \bar{t} + t_{m^*} + M$ is similar and is omitted. Suppose to the contrary, that $|\eta(s', \bar{u})(t)| \geq r_0$ for some $s' > 0$, $t < \bar{t} + t_{m^*} - M$. Define
\[
s_0 = \min\{s > 0 | \|\eta(s, \bar{u})\|_{L^\infty(-\infty, \bar{t} + t_{m^*} - M)} = r_0\}.
\] (3.18)

$s_0$ is well-defined by (3.9). Let $\bar{t} \in [\bar{t} + t_{m^*}, \bar{t} + t_{m^*} + M - 1]$ with
\[
\|\eta(s_0, u)\|_{W^{1,2}(\bar{t}, \bar{t} + 1)} < B^2/M < r_0^2/4,
\] (3.19)
using (2.5). Define

\[ \varphi(t) = \begin{cases} 
1; & t \leq \hat{t} \\
\hat{t} + 1 - t; & \hat{t} \leq t \leq \hat{t} + 1 \\
0; & t \geq \hat{t} + 1.
\end{cases} \]  

(3.20)

Define

\[ u_0 = \eta(s_0, \bar{u}), \quad w = \varphi u_0. \]  

(3.21)

\[ |\varphi| \leq 1 \text{ and } |\varphi'| \leq 1, \text{ so by Lemma 2.4, } \|w\| \leq 2 \|u_0\| \leq 2B. \]  

Now, using (2.4),

\[ I'(u_0)w = \int_{\mathbb{R}} u'_0 \cdot w + u_0 \cdot w - W'(t, u_0) w(t) \, dt \]

\[ = \int_{-\infty}^{\hat{t} + t_m - M} |u'_0|^2 + |u_0|^2 - W'(t, u_0) u_0(t) \, dt \]

\[ + \int_{\hat{t} + t_m - M}^{\hat{t} + 1} |u'_0|^2 + |u_0|^2 - W'(t, u_0) u_0(t) \, dt \]

\[ + \int_{\hat{t} + 1}^{\hat{t} + t_m - M} u'_0 \cdot (\varphi u_0)' + \varphi(t)|u_0|^2 - W(t, \varphi u_0) \varphi u_0 \, dt \]  

(3.22)

\[ \geq \frac{1}{2} \int_{-\infty}^{\hat{t} + t_m - M} |u'_0|^2 + |u_0|^2 \, dt + \frac{1}{2} \int_{\hat{t} + t_m - M}^{\hat{t} + 1} |u'_0|^2 + |u_0|^2 \, dt \]

\[ + \int_{\hat{t} + 1}^{\hat{t} + t_m - M} u'_0 \cdot (\varphi' u_0 + \varphi u'_0) + \varphi u'_0 - \frac{1}{2} \varphi^2 u_0^2 \, dt \]

\[ \geq \frac{1}{2} \|u_0\|_{L^\infty(-\infty, \hat{t} + t_m - M)}^2 - \int_{\hat{t} + 1}^{\hat{t} + t_m - M} |u'_0|^2 + u_0^2 \, dt \geq \frac{1}{2} r_0^2 - \frac{1}{4} r_0^2 = \frac{1}{4} r_0^2. \]

Thus \( \|I'(u_0)\| \geq \|I'(u_0)w\|/\|w\| \geq r_0^2/(8B) \), contradicting (3.14). Proposition 3.1, and hence Theorem 1.1, is proven. \( \square \)
