OPEN COVERS AND INFINITARY OPERATIONS IN C^∞ -RINGS¹⁾

by Eduardo J. DUBUC

INFINITE ADDITIONS.

In the C^∞ -ring $C^\infty(\mathbb{R}^n)$ of smooth real valued functions, one can define elements (functions) by *adding certain infinite families*. A typical application of this method is the following: Suppose $M \rightarrow \mathbb{R}^n$ is a closed smooth submanifold, and let $h: M \rightarrow \mathbb{R}$ be a smooth function defined on M . By definition this means that there are open sets $U_\alpha \subset \mathbb{R}^n$, $\alpha \in \Gamma$, such that they cover M , and smooth functions $h_\alpha: U_\alpha \rightarrow \mathbb{R}$ such that

$$\forall p \in U_\alpha \cap M, \quad h_\alpha(p) = h(p).$$

Let U_0 be $\mathbb{R}^n - M$, and take any function (e. g. the zero function) $h_0: U_0 \rightarrow \mathbb{R}$. We then have an open covering U_α , $\alpha \in \Gamma + \{0\}$, of the whole space $\mathbb{R}^n$, and functions $h_\alpha: U_\alpha \rightarrow \mathbb{R}$ such that

$$\forall p \in U_\alpha \cap M, \quad h_\alpha(p) = h(p).$$

(since $U_0 \cap M = \emptyset$). This family does not agree in the intersections $U_\alpha \cap U_\beta$; thus it does not define a global function $f: \mathbb{R}^n \rightarrow \mathbb{R}$ which extends h . However, we can construct an extension of h . Let W_i be a locally finite refinement of U_α , for each i take α such that $W_i \subset U_\alpha$, and let $g_i: W_i \rightarrow \mathbb{R}$ be equal to $h_\alpha|_{W_i}$. Let ϕ_i be an associated partition of unity. The functions $f_i = \phi_i g_i$ are defined globally, $f_i: \mathbb{R}^n \rightarrow \mathbb{R}$, and have support contained in W_i . (This is so since $\text{support}(\phi_i) \subset W_i$ by definition.) It follows that the equality $f = \sum_i f_i$ defines a function $f: \mathbb{R}^n \rightarrow \mathbb{R}$ such that

$$\forall x \in \mathbb{R}^n, \quad f(x) = \sum_i f_i(x)$$

(which is a *finite sum* on an open neighborhood of x). If we compute f at

1) Partially supported by the Danish Natural Science Research Council.

a point $p \in M$, we have:

$$\begin{aligned} f(p) &= \sum_i f_i(p) = \sum_{i|p \in W_i} f_i(p) = \sum_{i|p \in W_i} \phi_i(p) g_i(p) \\ &= \sum_{i|p \in W_i} \phi_i(p) h(p) = h(p) \sum_i \phi_i(p) = h(p). \end{aligned}$$

Thus f is an extension of h .

Two questions arise:

- I. Which is the algebraic meaning of these infinitary additions?
- II. To which extent can they be defined and performed in arbitrary C^∞ -rings of finite type $A = C^\infty(\mathbb{R}^n)/I$?

In particular, can we give a meaning to expressions of the form $a = \sum_\alpha a_\alpha$, $a_\alpha \in A$? In a way such that if $a_\alpha = [f_\alpha]$, $f_\alpha \in C^\infty(\mathbb{R}^n)$, and the f_α can be added in $C^\infty(\mathbb{R}^n)$ defining a function $f = \sum_\alpha f_\alpha$ (as before), then $a = [f]$ (where brackets indicate equivalence class modulo I). That this is not always possible is seen as follows: Let

$$I = (h \mid h \text{ is of compact support})$$

and let ϕ_α be a partition of unity such that $\phi_\alpha \in I$ for all α . Let

$$a_\alpha = [\phi_\alpha] \quad \text{and} \quad a = \sum_\alpha a_\alpha.$$

Then $a = I$ since $I = \sum_\alpha \phi_\alpha$ in $C^\infty(\mathbb{R}^n)$. But also $a_\alpha = [0]$ and then $a = 0$ since $0 = \sum_\alpha 0$ in $C^\infty(\mathbb{R}^n)$. Thus $I = 0$ in A , which is impossible since $I \not\subset 0$. We see that a condition is needed in the ideal that presents A . Namely, that if $l_\alpha \in I$ and the l_α can be added in $C^\infty(\mathbb{R}^n)$ defining a function $l = \sum_\alpha l_\alpha$ (as before), then $l \in I$. This leads to the notion of *ideal of local character* (cf. Definition 6, iv).

ANSWER TO QUESTION II.

The first step is to define the *open cover topology* in the category $\mathcal{Q}_{f,t}^{op}$, dual of the category of C^∞ -rings of finite type. Given a C^∞ -ring A and an element $a \in A$, we denote $A \rightarrow A \{a^{-1}\}$ the solution in $\mathcal{Q}$ to the universal problem of making a invertible (cf. [1, 2]). The following is straightforward:

1. PROPOSITION. Given any morphism $\phi: A \rightarrow B$ and element $a \in A$, the diagram

$$\begin{array}{ccc} A & \xrightarrow{\quad} & A\{a^{-1}\} \\ \phi \downarrow & & \downarrow \\ B & \xrightarrow{\quad} & C \end{array}$$

is a pushout diagram iff $C = B\{\phi(a)^{-1}\}$.

We recall the following

2. PROPOSITION. Let $U \subset \mathbb{R}^n$ be an open set, and let f be such that $U = \{x \mid f(x) \neq 0\}$. Then $C^\infty(\mathbb{R}^n) \rightarrow C^\infty(U) = C^\infty(\mathbb{R}^n)\{f^{-1}\}$.

PROOF. The basic idea is to consider the map

$$U \rightarrow \mathbb{R}^{n+1}; p \mapsto (p, f(p)^{-1})$$

which makes U the closed sub-manifold of $\mathbb{R}^{n+1}$ defined by the equation $1 - x_{n+1}f(p) = 0$. Then use the fact that this equation is independent to deduce that the equalizer is preserved when taking the C^∞ -rings of smooth functions (cf. [1, 2]). A different proof of the preservation of this equalizer is given in [4].

3. DEFINITION. The open cover topology in $\mathcal{Q}_{f,t}^{op}$ is the topology generated by the empty family covering $\{0\}$, and families of the form

$$C^\infty(\mathbb{R}^n) \rightarrow C^\infty(U_\alpha), \text{ for all } n \text{ and all open coverings } U_\alpha \text{ of } \mathbb{R}^n.$$

It follows from Propositions 1 and 2 that basic (generating) covers of an arbitrary C^∞ -ring of finite type A are families $A \rightarrow A\{a_\alpha^{-1}\}$ which can be completed into pushout diagrams

$$\begin{array}{ccc} C^\infty(\mathbb{R}^s) & \xrightarrow{\quad} & C^\infty(V_\alpha) \\ \phi \downarrow & & \downarrow \\ A & \xrightarrow{\quad} & A\{a_\alpha^{-1}\} \end{array}$$

where $V_\alpha = \{x \mid g_\alpha(x) \neq 0\}$ is an open cover of $\mathbb{R}^s$ and $\phi(g_\alpha) = a_\alpha$. The morphism ϕ can be chosen to be a quotient map. Let $A = C^\infty(\mathbb{R}^n)/I$; then, since $C^\infty(\mathbb{R}^s)$ is free, there is a smooth function $f: \mathbb{R}^n \rightarrow \mathbb{R}^s$ making

the following triangle commutative :

$$\begin{array}{ccc} C^\infty(\mathbb{R}^s) & \xrightarrow{f^*} & C^\infty(\mathbb{R}^n) \\ & \searrow \phi & \downarrow \\ & & A \end{array}$$

One checks then that the following diagrams are pushouts :

$$\begin{array}{ccc} C^\infty(\mathbb{R}^n) & \longrightarrow & C^\infty(U_\alpha) \\ \downarrow & & \downarrow \\ A & \longrightarrow & A\{a_\alpha^{-1}\} \end{array}$$

where

$$U_\alpha = f^{-1}(V_\alpha) = \{x \mid f_\alpha(x) \neq 0\}, \quad f_\alpha = g_\alpha f,$$

is an open cover of $\mathbb{R}^n$ and $a_\alpha = [f_\alpha]$.

Open covers $C^\infty(\mathbb{R}^n) \rightarrow C^\infty(U_\alpha)$ are *effective epimorphic families*. This just means that given a compatible family $f_\alpha \in C^\infty(U_\alpha)$ (meaning that they agree in the intersections), there exists a unique $f \in C^\infty(\mathbb{R}^n)$ such that $f|_{U_\alpha} = f_\alpha$. (Remark that $C^\infty(U_\alpha \cap U_\beta)$ is the pushout of $C^\infty(U_\alpha)$ with $C^\infty(U_\beta)$ over $C^\infty(\mathbb{R}^n)$.) However, they are not *universal*. Open covers of an arbitrary A will not, in general, be effective epimorphic families. For example, let as before I be the ideal

$$I = (h \mid h \text{ is of compact support}),$$

and let ϕ_α be a partition of unity such that $\phi_\alpha \in I$ for all α . Then the diagrams

$$\begin{array}{ccc} C^\infty(\mathbb{R}^n) & \longrightarrow & C^\infty(U_\alpha) \\ \downarrow & & \downarrow \\ A & \longrightarrow & \{0\} = A\{a_\alpha^{-1}\} \end{array}$$

are pushout diagrams for all α , where U_α is the open covering

$$U_\alpha = \{x \mid \phi_\alpha(x) \neq 0\}, \quad A = C^\infty(\mathbb{R}^n)/I, \quad \text{and} \quad a_\alpha = [\phi_\alpha] = 0.$$

On the way we see that the empty family covers A since it covers $\{0\}$

(use composition of coverings).

Consider now an open covering of an arbitrary C^∞ -ring $A = C^\infty(\mathbb{R}^n)/I$

$$\begin{array}{ccc} C^\infty(\mathbb{R}^n) & \longrightarrow & C^\infty(U_\alpha) \\ \downarrow & & \downarrow \\ A & \longrightarrow & A\{a_\alpha^{-1}\} \end{array}$$

$$U_\alpha = \{ x \mid f_\alpha(x) \neq 0 \} \quad \text{and} \quad a_\alpha = [f_\alpha].$$

For $b \in A$, we denote $b|_\alpha$ its image in $A\{a_\alpha^{-1}\}$. Suppose $b, b' \in A$ are such that $b|_\alpha = b'|_\alpha$ for all α . Let $b = [f]$ and $b' = [f']$. Then

$$[f|U_\alpha] = b|_\alpha \quad \text{and} \quad [f'|U_\alpha] = b'|_\alpha.$$

Thus $[f|U_\alpha] = [f'|U_\alpha]$, which means that $(f-f')|U_\alpha \in I|U_\alpha$. If the covering is going to be effective epimorphic, it should follow that $(f-f') \in I$. This leads to the notion of *ideal of local character* (cf. Definition 6, ii).

We recall the following elementary facts in order to fix the notation.

4. PROPOSITION. Let A be a C^∞ -ring and $p: A \rightarrow R$ a morphism into R , which we will also call a point of A . We denote $A \rightarrow A_p$ the solution in the category of C^∞ -rings to the universal problem of making invertible all the elements $a \in A$ such that $p(a) \neq 0$. There is a factorization of p , $A \rightarrow A_p \rightarrow R$, and A_p is a C^∞ -local ring. If $a \in A$, we denote $a|_p \in A_p$ its image in A_p . Suppose $A = C^\infty(\mathbb{R}^n)/I$, let $U \subset \mathbb{R}^n$ open, f such that $U = \{ x \mid f(x) \neq 0 \}$, and $a = [f]$. Consider the following diagram (where the upper square is a pushout):

$$\begin{array}{ccc} C^\infty(\mathbb{R}^n) & \longrightarrow & C^\infty(U) \\ \downarrow & & \downarrow \\ A & \longrightarrow & A\{a^{-1}\} \\ \downarrow & \nearrow \text{dashed} & \downarrow p \\ A_p & \longrightarrow & R \end{array}$$

Given a point p of A , $p: A \rightarrow R$, since $C^\infty(\mathbb{R}^n)$ is free, p can be identified with a point of $\text{Zeros}(I) \subset \mathbb{R}^n$ which we will also denote p . When

there exist factorizations (necessarily unique) as shown in the dotted arrows, p can be identified with a point of $A\{a^{-1}\}$, which we will also denote by p . Then

$$p \text{ is a point of } A\{a^{-1}\} \Leftrightarrow p(a) \neq 0 \Leftrightarrow p \in U.$$

It follows that if $A \rightarrow A\{a_\alpha^{-1}\}$ is an open cover and p is a point of A then there exists α such that p is a point of $A\{a_\alpha^{-1}\}$ (since there exist α such that $p \in U_\alpha$).

PROOF. This is all rather straightforward. For a proof, cf. [2, Exposé 11].

Suppose now $b, b' \in A$ are such that $b|_p = b'|_p$ for all points p of A . Let $b = [f]$ and $b' = [f']$. Then

$$b|_p = [f|_p] \text{ and } b'|_p = [f'|_p].$$

Thus $[f|_p] = [f'|_p]$, which means that $(f-f')|_p \in I|_p$. If we want to deduce that $b = b'$, it should follow that $(f-f') \in I$. This leads to the notion of *ideal of local character* (cf. Definition 6, i).

5. DEFINITION. A family $l_i \in C^\infty(\mathbb{R}^n)$ (indexed by an arbitrary set) is *locally finite* if there is an open covering U_α such that, for every α , $l_i|_{U_\alpha} = 0$ except for a finite number of i . Equivalently, if each point p of $\mathbb{R}^n$ has an open neighborhood U such that $l_i|_U = 0$ except for a finite number of i .

Given a locally finite family l_i , the finite sums $\sum_i l_i|_{U_\alpha} \in C^\infty(U_\alpha)$ form a compatible family. Thus there exists a unique

$$l \in C^\infty(\mathbb{R}^n) \text{ such that } l|_{U_\alpha} = \sum_i l_i|_{U_\alpha}.$$

We denote this l by the formula $l = \sum_i l_i$.

6. DEFINITION. An ideal $I \in C^\infty(\mathbb{R}^n)$ is of *local character* if it satisfies any one of the following equivalent conditions:

- i) $(f|_p \in I|_p \text{ for all } p \in \text{Zeros}(I)) \Rightarrow f \in I$.
- ii) $(f|_{U_\alpha} \in I|_{U_\alpha} \text{ for some open cover } U_\alpha) \Rightarrow f \in I$.
- iii) $\phi_\alpha f \in I$ for some partition of unity $\phi_\alpha \Rightarrow f \in I$.
- iv) $l_i \in I$ for all $i \Rightarrow (\sum_i l_i) \in I$ for every locally finite family l_i .

PROOF OF THE EQUIVALENCE. The antecedents of the first three implications are themselves equivalent, cf. [1], Lemma 10, and for detailed proof, [2] Théorème 1.5; thus the equivalence of the first three conditions. That $iv \Rightarrow iii$ is immediate since $\phi_\alpha f$ is a locally finite family and $f = \Sigma \phi_\alpha f$. Finally, it is evident that $ii \Rightarrow iv$. Notice that the implications in the first three conditions always hold in the other sense.

It is clear that any ideal I has a «closure» of local character; namely

$$\hat{I} = \{ f \mid f|_p \in I|_p \quad \forall p \in \text{Zeros}(I) \}.$$

$\hat{I}$ can also be seen as the closure of I under additions of locally finite families. Let $\mathcal{B}$ be the category of C^∞ -rings presented by an ideal of local character. Let

$$A = C^\infty(\mathbb{R}^n)/I \quad \text{and} \quad rA = C^\infty(\mathbb{R}^n)/\hat{I}.$$

Then we have a canonical (quotient) map $A \rightarrow rA$ and the passage $A \rightarrow rA$ is clearly a left adjoint for the inclusion $\mathcal{B} \rightarrow \mathcal{A}_{f,t}$. Thus $\mathcal{B}$ is closed under all inverse limits and has all colimits. These colimits will not coincide in general with the respective construction in $\mathcal{A}_{f,t}$. We remark that, since $\text{Zeros}(I) = \text{Zeros}(\hat{I})$, A and rA have the same points.

7. EXAMPLES. 1° Let $A = C_0^\infty(\mathbb{R})$, $B = C^\infty(\mathbb{R})$. Then $A, B \in \mathcal{B}$. By construction, $A \otimes_\infty B = C^\infty(\mathbb{R}^2)/I$, where

$$I = \{ f \mid \exists \eta > 0, f(x, y) = 0 \quad \forall x \mid |x| < \eta \}.$$

This ideal is not of local character:

$$\hat{I} = \{ f \mid f = 0 \text{ on an arbitrary neighborhood of the } y\text{-axis} \}.$$

The coproduct of A with B in $\mathcal{B}$ does not coincide then with the one performed in $\mathcal{A}_{f,t}$.

2° Let $A = C_0^\infty(\mathbb{R})$ and $a = x|_0$. Then

$$A \{ a^{-1} \} = C_0^\infty(\mathbb{R}) \{ x|_0^{-1} \} = C^\infty(\mathbb{R}^*)/J,$$

where $\mathbb{R}^* = \mathbb{R} - \{0\}$ and

$$J = \{ f \mid \exists U \mid 0 \in U, f|_U = 0 \} \subset C^\infty(\mathbb{R}^*).$$

We see this because the following is a pushout diagram :

$$\begin{array}{ccc} C^\infty(\mathbb{R}) & \longrightarrow & C^\infty(\mathbb{R}^*) = C^\infty(\mathbb{R})\{x^{-1}\} \\ \downarrow & & \downarrow \\ C_0^\infty(\mathbb{R}) & \longrightarrow & C^\infty(\mathbb{R}^*)/J = C_0^\infty(\mathbb{R})\{x|_0^{-1}\} \end{array}$$

(cf. Proposition 1). Now, the ring $A\{a^{-1}\}$ has the presentation

$$A\{a^{-1}\} = C^\infty(\mathbb{R}^2)/(I, 1-xy),$$

where I is the ideal in 1 above. Thus the localization $A\{a^{-1}\}$ in $\mathcal{B}$ does not coincide with the one performed in $\mathcal{A}_{f,t}$. Since $\text{Zeros}(I, 1-xy) = \emptyset$, we have that $1 \in (I, 1-xy)^\wedge$. Thus $A\{a^{-1}\} = \{0\}$ in $\mathcal{B}$. This means that if $\phi: C_0^\infty(\mathbb{R}) \rightarrow B$ is any morphism, B is in $\mathcal{B}$, and $\phi(x|_0)$ invertible, then $B = \{0\}$. This is not so if B is not in $\mathcal{B}$.

In what follows we will utilize the *same notation* as in $\mathcal{A}_{f,t}$ for the constructions performed in $\mathcal{B}$. Since they are defined by the same universal properties, we have :

8. PROPOSITION. *Propositions 1 and 4 remain valid for the category $\mathcal{B}$. In addition, since all finitely generated ideals are of local character (cf. [1, 2]), if A is of finite presentation, then for any $a \in A$, $A\{a^{-1}\}$ constructed in $\mathcal{A}_{f,t}$ is already in $\mathcal{B}$. Thus Proposition 2 remains valid also for the category $\mathcal{B}$. Furthermore, if A is in $\mathcal{B}$, then for any elements $b, b' \in A$,*

$$b = b' \text{ iff } b|_p = b'|_p \text{ for all points } p \text{ of } A.$$

9. PROPOSITION. *The open coverings are universal effective epimorphic families in the category $\mathcal{B}^{op}$.*

PROOF. The proof is essentially a repetition of the argument given at the beginning of this article. Let $A = C^\infty(\mathbb{R}^n)/I$, I of local character, U_α an open cover of $\mathbb{R}^n$, f_α such that $U_\alpha = \{x \mid f_\alpha(x) \neq 0\}$ and $a_\alpha \in A$, $a_\alpha = [f_\alpha]$. We consider the pushout diagram in $\mathcal{B}$:

$$\begin{array}{ccc} C^\infty(\mathbb{R}^n) & \longrightarrow & C^\infty(U_\alpha) \\ \downarrow & & \downarrow \\ A & \longrightarrow & A\{a_\alpha^{-1}\} \end{array}$$

Let $b_\alpha \in A\{a_\alpha^{-1}\}$ be a compatible family. This implies that for all points of $A\{a_\alpha^{-1}, a_\beta^{-1}\}$, $b_\alpha|_p = b_\beta|_p$. Thus, for all p in A there is a well defined $b(p) \in A_p$, $b(p) = b_\alpha|_p$ for any α such that p is in A_α . We shall construct an element

$$b \in A \text{ such that } b|_p = b(p) \text{ for all } p \text{ in } A.$$

Let $h_\alpha \in C^\infty(U_\alpha)$ such that $b_\alpha = [h_\alpha]$, let W_i be a locally finite refinement of U_α , for each i take α such that $W_i \subset U_\alpha$, and let $g_i \in C^\infty(W_i)$ be equal to $h_\alpha|_{W_i}$. Thus, for all p in W_i , $[g_i|_p] = b(p)$. Let ϕ_i be an associated partition of unity. The functions $l_i = \phi_i g_i$ are defined globally, $l_i \in C^\infty(\mathbb{R}^n)$, and have support contained in W_i . Thus, given any p in A , if $p \notin W_i$, $l_i|_p = 0$, and if $p \in W_i$,

$$[l_i|_p] = [\phi_i|_p] b(p),$$

Since the family l_i is locally finite (Definition 5), we have a function $l = \sum_i l_i$. Let $b = [l]$. Then, for any p in A ,

$$b|_p = [\sum_i l_i|_p] = \sum_{i|p \in W_i} [l_i|_p] = b(p) \sum [\phi_i|_p] = b(p).$$

Given any α , $b|_\alpha = b_\alpha$ since for all p in $A\{a_\alpha^{-1}\}$, $b|_p = b_\alpha|_p$ and $A\{a_\alpha^{-1}\}$ is in $\mathcal{B}$. In the same way one checks the uniqueness of such a , b , since all points of A are in some $A\{a_\alpha^{-1}\}$. This finishes the proof.

10. DEFINITION - PROPOSITION. Given any C^∞ -ring A presented by an ideal of local character, a family $b_i \in A$ (indexed by an arbitrary set) is *locally finite* if there is an open covering $A \rightarrow A\{a_\alpha^{-1}\}$ such that for every α , $b_i|_\alpha = 0$ except for a finite number of i . Given such a family, the finite sums $\sum_i b_i|_\alpha \in A\{a_\alpha^{-1}\}$ form a compatible family. It follows then from the previous proposition that there exists a unique

$$b \in A \text{ such that } b|_\alpha = \sum_i b_i|_\alpha.$$

We denote this b by the formula $b = \sum_i b_i$. Given any morphism $\phi: A \rightarrow B$ in $\mathcal{B}$, the family $\phi(b_i) \in B$ is also locally finite, and $\phi \sum_i b_i = \sum_i \phi(b_i)$.

This finishes the answer to Question II. Infinite additions of locally finite families make sense and can be performed in certain C^∞ -rings. The

C^∞ -rings which have this extra structure are precisely those presented by an ideal of local character. Before passing to Question I, we make a final remark on the open covering topology.

11. PROPOSITION. *Given any C^∞ -ring $A \in \mathcal{G}_{f,t}$ and a family $a_\alpha \in A$, $A \rightarrow A\{a_\alpha^{-1}\}$ covers in the open covering topology iff for all points p in A there exists α such that p is in $A\{a_\alpha^{-1}\}$. Thus any C^∞ -ring without points is covered by the empty family.*

PROOF. One of the implications has already been seen (Proposition 4). Suppose then that for all p in A there is α such that p is in $A\{a_\alpha^{-1}\}$. Let $A = C^\infty(\mathbb{R}^n)/I$, $f_\alpha \in C^\infty(\mathbb{R}^n)$ such that

$$a_\alpha = [f_\alpha] \quad \text{and} \quad U_\alpha = \{x \mid f_\alpha(x) \neq 0\}.$$

The hypothesis means that for all $p \in \text{Zeros}(I) \subset \mathbb{R}^n$ there is α such that $p \in U_\alpha$. If $p \notin \text{Zeros}(I)$, there is

$$l \in I \quad \text{such that} \quad p \in U_l = \{x \mid l(x) \neq 0\}.$$

Thus the U_α together with the U_l form an open cover of $\mathbb{R}^n$. Let $b_l \in A$, $b_l = [l]$. Then $A \rightarrow A\{a_\alpha^{-1}\}$ together with $A \rightarrow A\{b_l^{-1}\}$ form an open cover of A . But $A\{b_l^{-1}\} = \{0\}$; thus it is covered by the empty family. By composition of coverings, it follows that $A \rightarrow A\{a_\alpha^{-1}\}$ is an open covering of A .

ANSWER TO QUESTION I.

We consider the free C^∞ -ring in λ generators, $\lambda \in \Gamma$, cf. [2]. This ring, which we denote $C^\infty(\mathbb{R}^\Gamma)$, is the ring of functions $\mathbb{R}^\Gamma \rightarrow \mathbb{R}$ which depend only on a finite number of variables, and which are smooth on these variables. Clearly, this is a ring of continuous functions (for the product topology in $\mathbb{R}^\Gamma$). If we take a locally finite family of functions $\mathbb{R}^\Gamma \rightarrow \mathbb{R}$ in $C^\infty(\mathbb{R}^\Gamma)$, and add it up, we get a continuous function which will not be in general in $C^\infty(\mathbb{R}^\Gamma)$. However, every point will have a neighborhood in which this function will coincide with the restriction of a function in $C^\infty(\mathbb{R}^\Gamma)$. We consider all functions ϕ which locally depend on a finite number of variables. More precisely, functions for which there exists an

open cover $U_\alpha \subset R^\Gamma$, finite sets J_α , smooth functions h_α and factorizations as indicated in the following diagram (where ρ is the projection):

$$\begin{array}{ccc} U_\alpha & \xrightarrow{\quad} & R^\Gamma \\ \rho \downarrow & & \downarrow \phi \\ R^{J_\alpha} & \xrightarrow{h_\alpha} & R \end{array}$$

for all α . Thus we add to $C^\infty(R^\Gamma)$ all the functions needed to render the open covers of R^Γ effective epimorphic families. We will, for the lack of a better notation, denote this ring by ${}_\infty C^\infty(R^\Gamma)$. Thus a function ϕ is in ${}_\infty C^\infty(R^\Gamma)$ iff for each point $p \in R^\Gamma$, there is an open neighborhood U of p , a finite set of indices $\{\lambda_1, \lambda_2, \dots, \lambda_n\}$ and a smooth function of n variables h such that for all $(x_\lambda) \in U$, $\lambda \in \Gamma$,

$$\phi(x_\lambda) = h(x_{\lambda_1}, \dots, x_{\lambda_n}).$$

We leave to the reader the proof of the following (where Γ and Λ are any sets, including finite):

12. PROPOSITION. *Given any $\phi \in {}_\infty C^\infty(R^\Gamma)$ and a Γ -tuple*

$$\phi_\lambda \in {}_\infty C^\infty(R^\Lambda), \quad (\phi_\lambda): R^\Lambda \rightarrow R^\Gamma,$$

the composite $\phi(\phi_\lambda) \in {}_\infty C^\infty(R^\Lambda)$.

It follows then that there is an infinitary algebraic theory in the sense of Linton (cf. [3]) which has as Γ -ary operations the rings ${}_\infty C^\infty(R^\Gamma)$. We shall call this theory the *infinitary theory of C^∞ -rings*. Its finitary part is the theory of C^∞ -rings, since ${}_\infty C^\infty(R^n) = C^\infty(R^n)$. Thus, this ring is still free on n generators for the infinitary theory. (The action of a Γ -ary operation on $C^\infty(R^n)$ is given in Proposition 12, with $\Lambda = n$.) All ${}_\infty C^\infty$ -rings of finite type are then quotients of $C^\infty(R^n)$ presented by ${}_\infty C^\infty$ -ideals, that is, ideals I such that the congruence

$$f \sim g \Rightarrow f - g \in I$$

is an ${}_\infty C^\infty$ -congruence. Recall that this congruence is always a C^∞ -congruence (cf. [1, 2]).

13. PROPOSITION. Let $A = C^\infty(\mathbb{R}^n)/I$ be a C^∞ -ring presented by an ideal I of local character. Then, A is an ${}_\infty C^\infty$ -ring. Or, equivalently, I is an ${}_\infty C^\infty$ -ideal.

PROOF. Let $\phi \in {}_\infty C^\infty(\mathbb{R}^\Gamma)$, and let

$$g_\lambda, f_\lambda \in C^\infty(\mathbb{R}^n), \lambda \in \Gamma, \text{ such that } g_\lambda - f_\lambda \in I.$$

Let p be any point of $\mathbb{R}^n$ and let $U \subset \mathbb{R}^\Gamma$ be an open neighborhood of the two points $(g_\lambda(p)), (f_\lambda(p)) \in \mathbb{R}^\Gamma$ where ϕ depends on a finite number of variables:

$$\phi(x_\lambda) = h(x_{\lambda_1}, \dots, x_{\lambda_k}) \text{ over } U,$$

for some $h \in C^\infty(\mathbb{R}^k)$. Let $W \subset \mathbb{R}^n$ be an open neighborhood of p such that

$$(g_\lambda)(W) \subset U \text{ and } (f_\lambda)(W) \subset U.$$

Then

$$(\phi(g_\lambda) - \phi(f_\lambda))|_W = (h(g_{\lambda_1}, \dots, g_{\lambda_k}) - h(f_{\lambda_1}, \dots, f_{\lambda_k}))|_W \in I|_W,$$

because

$$h(g_{\lambda_1}, \dots, g_{\lambda_k}) - h(f_{\lambda_1}, \dots, f_{\lambda_k}) \in I,$$

since all ideals are C^∞ -ideals. Thus the term $(\phi(g_\lambda) - \phi(f_\lambda))|_p$ is in $I|_p$. Since I is of local character, this implies $\phi(g_\lambda) - \phi(f_\lambda) \in I$.

The converse of this proposition says, in a way, that there are enough operations in the infinitary theory of C^∞ -rings to force any ${}_\infty C^\infty$ -ideal to be of local character. This is actually the case, and we prove it by showing that given any locally finite family $l_\lambda \in C^\infty(\mathbb{R}^n)$, there is an infinitary operation that adds it up.

14. PROPOSITION. Let $l_\lambda \in C^\infty(\mathbb{R}^n)$, $\lambda \in \Gamma$, be any locally finite family. Then, the following function:

$$L: \mathbb{R}^n \times \mathbb{R}^\Gamma \rightarrow \mathbb{R}, L(x_1, \dots, x_n, x_\lambda) = \sum_\lambda l_\lambda(x_1, \dots, x_n) x_\lambda$$

is in ${}_\infty C^\infty(\mathbb{R}^{n+\Gamma})$.

PROOF. Given any point $p \in \mathbb{R}^{n+\Gamma}$, $p = (a_1, \dots, a_n, a_\lambda)$, take an open neighborhood $U \subset \mathbb{R}^n$ of $(a_1, \dots, a_n)$, where all but a finite number of l_α

are zero. Then the open set $U \times \mathbb{R}^\Gamma$ is a neighborhood of p where L depends on only a finite number of variables.

Let $h_1, h_2, \dots, h_n$ and f_λ be any $(n + \Gamma)$ -tuple of smooth functions in k variables. The family (indexed by Γ) $l_\lambda(h_1, \dots, h_n)f_\lambda$ is a locally finite family in $C^\infty(\mathbb{R}^k)$, and it follows from Proposition 12 (with $k = \Gamma$) that the action of L for the ${}_\infty C^\infty$ -ring structure of $C^\infty(\mathbb{R}^k)$ is given by the formula

$$L(h_1, \dots, h_n, f_\lambda) = \sum_{\lambda} l_\lambda(h_1, \dots, h_n)f_\lambda.$$

We have

15. PROPOSITION. *Let l_λ and L be as in Proposition 14.*

i) *Given any n -tuple $h_1, \dots, h_n \in C^\infty(\mathbb{R}^k)$, $L(h_1, \dots, h_n, 0) = 0$.*

ii) *Given any ${}_\infty C^\infty$ -ideal $I \subset C^\infty(\mathbb{R}^k)$ and any $n + \Gamma$ -tuple $h_1, \dots, h_n, f_\lambda \in C^\infty(\mathbb{R}^n)$, if $f_\lambda \in I$ for all λ , then $\sum_{\lambda} l_\lambda(h_1, \dots, h_n)f_\lambda \in I$.*

iii) *Given any ${}_\infty C^\infty$ -ideal $I \subset C^\infty(\mathbb{R}^n)$ and any Γ -tuple $f_\lambda \in C^\infty(\mathbb{R}^n)$ if $f_\lambda \in I$ for all λ , then $\sum_{\lambda} l_\lambda f_\lambda \in I$.*

iv) *Given any ${}_\infty C^\infty$ -ideal $I \subset C^\infty(\mathbb{R}^n)$ and any locally finite family $f_\lambda \in C^\infty(\mathbb{R}^n)$, if $f_\lambda \in I$ for all λ , then $\sum_{\lambda} f_\lambda \in I$.*

PROOF. i is clear, and ii follows clearly from i. We get iii by putting

$$k = n \quad \text{and} \quad h_i = \pi_i \quad \text{the projections.}$$

Finally, observe that given any open set $U \subset \mathbb{R}^n$ and any smooth function f with $\text{Supp}(f) \subset U$, then there exists a function l with $\text{supp}(l) \subset U$ and such that $f = fl$. To prove iv, we apply this observation to each of the functions f_λ . The family l_λ so obtained is also locally finite; thus it has an associated operation L . iv follows then from iii.

16. COROLLARY. *Let A be a ${}_\infty C^\infty$ -ring of finite type. Then A is a C^∞ -ring presented by an ideal of local character.*

PROOF. Immediate from iv in the previous proposition and Definition 6, iv.

Thus, the ideals of local character are exactly the congruences for

the infinitary theory of C^∞ -rings. Remark that we have also proved that given any locally finite family f_λ in $C^\infty(\mathbb{R}^n)$, $\lambda \in \Gamma$, there is a $(n + \Gamma)$ -ary operation L such that

$$L(\pi_1, \dots, \pi_n, f_\lambda) = \sum_\lambda f_\lambda,$$

where π_i are the projections. Suppose now I is an ideal of local character, let $A = C^\infty(\mathbb{R}^n)/I$, let $e_i = [\pi_i]$ be the generators of A , and let

$$b_\lambda = f_\lambda(e_1, \dots, e_n) = [f_\lambda].$$

Then, by Definition-Proposition 10, b_λ is a locally finite family, and $[\sum_\lambda f_\lambda] = \sum_\lambda b_\lambda$. But since I is a ∞C^∞ -ideal, we also have

$$[L(\pi_1, \dots, \pi_n, f_\lambda)] = L(e_1, \dots, e_n, b_\lambda).$$

Thus, given any locally finite family $b_\lambda = [f_\lambda]$ in a C^∞ -ring A presented by an ideal of local character, $A = C^\infty(\mathbb{R}^n)/I$, if f_λ is locally finite in $C^\infty(\mathbb{R}^n)$, there is an infinitary operation L such that

$$L(e_1, \dots, e_n, b_\lambda) = \sum_\lambda b_\lambda,$$

where $e_1, \dots, e_n$ are generators of A . With this we finish the answer to Question I.
