STREAMLINE DIFFUSION METHODS FOR THE VLASOV-POISSON EQUATION (*)

Mohammad ASADZADEH (1)

Communicated by C. BARDOS

Abstract. — We prove error estimates for the streamline diffusion and the discontinuous Galerkin finite element methods for discretization of the Vlasov-Poisson equation.

Résumé. — Nous démontrons des estimations d'erreur pour la méthode de Galerkin discontinue pour la discrétisation de l'équation de Vlasov-Poisson.

0. INTRODUCTION

In this paper we prove error estimates for the streamline diffusion and the discontinuous Galerkin finite element methods for discretization of the 1, 2 and 3 dimensional Vlasov-Poisson equation. This extends results of Johnson and Saranen for the two-dimensional incompressible Euler and Navier Stokes equations [17].

The initial value problem for the Vlasov equation reads as follows: given the initial data \( f_0^\pm \), find the potential of the electric field \( \phi \) and the densities of ions (+) and electrons (−) \( f^\pm \) of a plasma such that

\[
\begin{aligned}
\frac{\partial f^\pm}{\partial t} + v \cdot \nabla_x f^\pm + \alpha^\pm \nabla_x \phi \cdot \nabla_v f^\pm &= 0, \\
\Delta_x \phi &= \beta \int_{\mathbb{R}^n} (f^+ (x,v,t) - f^- (x,v,t)) \, dv, \\
f^\pm (x,v,0) &= f_0^\pm (x,v),
\end{aligned}
\]

(0.1)

\( \nabla_x \phi \) is uniformly bounded and \( \nabla_x \phi \to 0 \) as \( |x| \to \infty \).

where $V_x = (\partial/\partial x_1, \partial/\partial x_2, \ldots, \partial/\partial x_n)$, $V_v = (\partial/\partial v_1, \partial/\partial v_2, \ldots, \partial/\partial v_n)$, and $\cdot$ is the inner product in $\mathbb{R}^n$, $\alpha^\pm = \mp e/m^\pm$, $\beta = -4 \pi e$, where $e$ is the unit of electric charge and $m^\pm$ are the masses of ions (+) and electrons (−).

If we assume that $f^+ = 0$, then (0.1) reduces to the following initial value problem for the Liouville-Newton equation

\begin{equation}
\frac{\partial f}{\partial t} + v \cdot \nabla_x f + \alpha \nabla_x \phi \cdot \nabla_v f = 0,
\end{equation}

\begin{equation}
(x, v, t) \in \mathbb{R}^n \times \mathbb{R}^n \times [0, T] := Q_T, T > 0,
\end{equation}

\begin{equation}
-\Delta_x \phi = \beta \int_{\mathbb{R}^n} f(x, v, t) \, dv,
\end{equation}

\begin{equation}
(x, t) \in \mathbb{R}^n \times [0, T] := \Omega_T, T > 0,
\end{equation}

\begin{equation}
f(x, v, 0) = f_0(x, v),
\end{equation}

\begin{equation}
(x, v) \in \mathbb{R}^n \times \mathbb{R}^n,
\end{equation}

where $\beta = 4 \pi \gamma m$, with $\gamma$ being the gravitational constant and $m$ the particle mass.

The Vlasov equation, in its complete form (0.1) emerging from application of many-particle theory to plasma physics, was introduced and studied by Vlasov in [23].

The existence of a unique classical solution for (0.1) for all time has been proved by Iordanskii [13] in the one-dimensional case $n = 1$, and for $n = 2$ by Ukai and Okabe [22], who also discuss existence of local in time classical solutions for $n \geq 3$. For the three-dimensional case existence of weak solutions for all time and existence of local in time classical solutions have been studied by Arsen'ev in [1] and [2], respectively.

The global in time results of [13] and [22] depend on Sobolev type estimates and can not be extended to higher dimensions. These methods do not need any restriction on the size of the initial data, which have only to be smooth enough. Global in time solutions for the three dimensional problem are given by Bardos and Degond [3], who consider small initial data and use the dispersive effect of the linearized equation to derive the existence of a global unique solution. A recent survey of a diffusion process approach to existence of a unique solution is given by Wollman [24].

Particle type methods have so far been the dominating numerical methods in plasma physics. These methods are known as vortex methods in fluid mechanics. For a mathematical analysis of vortex methods, we refer to [4], and surveys on particle methods can be found in [11]. Particle methods for the initial value problem (0.2) have been studied by Cottet and Raviart [6] and [7] for the one-dimensional case. Convergence of a particle in-cell method in one, two and three dimensional cases is studied by Neunzert and

\begin{equation}
\n
M^AN Modélisation mathématique et Analyse numérique
Mathematical Modelling and Numerical Analysis
Wick [20]. Long-time-scale particle simulations are considered by Denavit [8].

In this paper, we study the streamline diffusion and the discontinuous Galerkin finite element methods using piecewise polynomials of degree $k$, for the one, two and three-dimensional Vlasov-Poisson equation (0.2) in a domain $\Omega = \Omega_x \times R^n$, $n = 1, 2, 3$, where $\Omega_x \subset R^n$ is bounded and simply connected and $f_0$ is compactly supported in $\Omega_x = R^n$. Following the techniques of Johnson and Saranen in [17], we derive error estimates of order $O(h^{k+1/2})$ assuming sufficient regularity of the exact solution.

An outline of this note is as follows. In Section 1 we briefly review the existence of a unique solution for the continuous problem (0.2). In Section 2 we introduce notation and assumptions which will be used through the paper. Section 3 is devoted to the streamline diffusion method and in the concluding Section 4 we study the discontinuous Galerkin finite element method.

1. THE CONTINUOUS PROBLEM

In this section we review an analytic approach for existence of a unique classical solution for (0.2), in the large in time for $n = 1, 2$ and local in time for $n \geq 3$, assuming sufficiently smooth initial data $f_0$ with suitable decay at infinity. For a global existence theorem for $n = 3$ with small initial data we refer to [3].

We start by splitting (0.2) in two parts.

(I) The Poisson equation (0.2b) with $f$ replaced by a given function $g$ and the electrostatic potential $\phi$ satisfying (0.2d);

(II) The Vlasov equation (0.2a) with initial condition (0.2c).

By solving $\phi$ from (I) and replacing this $\phi$ in (II) we assign a function $f$ to a given function $g$ which we will denote by $f = \Lambda[g]$. A fixed point of the mapping $\Lambda$ on a certain set $S$ will give us a classical solution of (0.2).

Let us describe the steps (I) and (II) in more detail.

I. Given $g = g(x, v, t)$ find the solution $\phi = \phi(x, t)$ of Poisson equation

$$
\begin{align*}
-\Delta_x \phi &= \beta \int_{R^n} g(x, v, t) \, dv, \quad (x, t) \in \Omega_T = R^n \times [0, T], \quad T > 0, \\
\nabla_x \phi &\text{ is uniformly bounded and } \nabla_x \phi \to 0, \text{ as } |x| \to \infty.
\end{align*}
$$

The solution $\phi$ of (1.1) is given by

$$
\phi(x, t) = \beta \int_{R^n} K(x - x') \left[ \int_{R^n} g(x', v, t) \, dv \right] dx',
$$

where $K$ is the Green's function.
where \( K \) is the fundamental solution of \(- \Delta_x \) in \( R^n \), \( n \geq 2 \) (the case \( n = 1 \) will be considered separately below),

\[
K(x) = \begin{cases} 
\frac{1}{(2 - n) \omega_n} \frac{1}{|x|^{n-2}}, & n \geq 3 \\
\frac{1}{2 \pi} \log |x|, & n = 2 .
\end{cases}
\]

Here \( \omega_n \) is the surface area of the unit sphere in \( R^n \), \( (n \geq 3) \). With this \( \phi \) we then solve the following initial value problem.

II. Given \( \phi \) and \( f_0 \) find the solution \( f = f(x, v, t) \) of Vlasov equation

\[
\frac{\partial f}{\partial t} + v \cdot \nabla_x f + \alpha \nabla_x \phi \cdot \nabla_v f = 0 , \quad (x, v, t) \in Q_T = R^n \times R^n \times [0, T], \quad T > 0 ,
\]

\[
f(x, v, 0) = f_0(x, v) , \quad (x, v) \in R^n \times R^n .
\]

The problem II is equivalent to solving the following Hamiltonian system (characteristic equations of (1.4))

\[
\begin{align*}
\frac{dX(s)}{ds} &= V(s) , \\
\frac{dV(s)}{ds} &= \alpha (\nabla_x \phi)(s, X) ,
\end{align*}
\]

for \( (X, V) \in R^n \times R^n \). For \( \phi \) sufficiently smooth (see assumptions on \( E = \nabla_x \phi \) in [3]) and with the Cauchy data

\[
\begin{align*}
X(t ; x, v, t) &= x , \\
V(t ; x, v, t) &= v ,
\end{align*}
\]

(1.5) has a unique solution which we shall denote by

\[
s \rightarrow (X(s ; x, v, t), V(s ; x, v, t)) .
\]

The solution of (1.4) is then given by

\[
f(x, v, t) = f_0(X(0 ; x, v, t), V(0 ; x, v, t)) .
\]

It remains to construct a set \( S \) of functions \( g \) in such a way that the map \( \Lambda \) defined on this set can be shown to have a fixed point \( f = \Lambda f, \quad f \in S \). For this purpose we define for \( 0 \leq \sigma \leq 1 \) the following class of functions

\[
B^{\ell + \sigma}(A) = \{ g \in C_b(A) : D^{\sigma}_{|\alpha| \leq \ell} g \in C_b(A) \text{ and } D^{\sigma}_{|\alpha| = \ell} g \in C_{ulH}^g(A) \} ,
\]

where \( \ell \in Z^+ \), \( C_b(A) \) is the class of continuous and bounded functions in \( A \) and \( C_{ulH}^g(A) \) is the set of uniformly Hölder continuous functions in \( A \) of
order \( \sigma \). \( B^\sigma_1(A) \) is a Banach space with the obvious \( \| \cdot \|_{B^\sigma_1} \) norm. Now let \( S \subset B^0(Q_T) \) be a set consisting of all functions \( g = g(x, v, t) \) which satisfy the following conditions

\[
\text{(i)} \quad g \in B^\delta(Q_T), \\
\text{(ii)} \quad |g(x, v, t)| \leq M_1(1 + |x|)^{-\gamma} (1 + |v|)^{-\gamma}, \\
\text{(iii)} \quad \int_{R^n \times R^n} |g(x, v, t)| \, dx \, dv \leq M_2, \\
\text{(iv)} \quad \int_{R^n} |g(x, v, t)| \, dv \leq M_0(t),
\]

where \( \gamma, M_1 \) and \( M_2 \) are positive constants, and \( M_0(t) \) is a positive nondecreasing function of \( t \) on \( [0, T] \). Then by Propositions 3.1 and 7.1 of [22]:

1) \( S \) is a compact convex subset of \( B^0(Q_T) \),
2) \( \Lambda \) maps \( S \) into itself continuously in the topology of \( B^0(Q_T) \).

Thus by Schauder's fixed point theorem \( \Lambda \) has a fixed point \( f \) in \( S \), see Dugundji [9, p. 415].

On the other hand Propositions 4.1 and 6.1 of [22] guarantee that any fixed point of \( \Lambda \) in \( S \) gives a classical solution of (0.2), provided that \( f_0 \) satisfies the condition (1.9) below

\[
\text{(i)} \quad f_0 \in B^1(R^n \times R^n), \\
\text{(ii)} \quad |f_0(x, v)| \leq k_0(1 + |x|)^{-2\gamma} (1 + |v|)^{-2\gamma}, \; \gamma > n, \; k_0 \geq 0.
\]

For uniqueness results we refer to [6], [22] and [3] in one, two and three dimensions respectively.

Remark 1.1: For the case \( n = 1 \) assuming a periodicity on \( x \), the Poisson equation (1.1) becomes

\[
\left\{ \begin{array}{l}
- \frac{\partial^2 \phi}{\partial x^2} = 1 - \int_{-\infty}^{\infty} f(x, v, t) \, dv, \\
\phi(0, t) = \phi(p, t), \; t \geq 0,
\end{array} \right. \tag{1.1}'
\]

and the kernel \( K \) being the Green function

\[
K(x - x') = \begin{cases} 
    x \left(1 - \frac{x'}{p} \right), & 0 \leq x \leq x', \\
    \left(1 - \frac{x}{p} \right) x', & x' \leq x \leq p,
\end{cases} \tag{1.3}'
\]
where \( p \) is the period, i.e. \( f(0, v, t) = f(p, v, t) \). For more details in the one-dimensional case we refer to [6], [7] and Iordanskii [13].

2. NOTATION AND ASSUMPTIONS

We assume now that \((x, v) \in \Omega = \Omega_x \times \Omega_v \subset \mathbb{R}^n \times \mathbb{R}^n, n = 1, 2, 3\), where \( \Omega_v := \mathbb{R}^n \) and \( \Omega_x \) is a bounded simply connected domain. We further assume that

\[
(2.1) \quad f_0 \text{ is compactly supported in } \Omega_v = \mathbb{R}^n.
\]

We shall consider the following variant of the initial value problem (0.2) : given \( T > 0 \) find \((f, \phi)\) such that

\[
(2.2) \quad \begin{cases}
\frac{\partial f}{\partial t} + v \cdot \nabla_x f - \nabla_x \phi \cdot \nabla_v f = 0, & (x, v, t) \in \Omega \times [0, T] \equiv Q_T, \\
f(x, v, 0) = f_0(x, v), & (x, v) \in \Omega = \Omega_x \times \mathbb{R}^n, \\
f(x, v, t) = 0, & (x, v, t) \in \Gamma_v^- \times \mathbb{R}^n \times [0, T],
\end{cases}
\]

with \( \phi \) satisfying

\[
(2.3) \quad \begin{cases}
- \Delta_x \phi = \int_{\mathbb{R}^n} f(x, v, t) \, dv, & (x, t) \in \mathbb{R}^n \times [0, T] \equiv \Omega_T, \\
\nabla_x \phi \text{ is uniformly bounded and } \nabla_x \phi \to 0, \text{ as } |x| \to \infty,
\end{cases}
\]

and for \( v \in \mathbb{R}^n, \)

\[
\Gamma_v^- = \{ x \in \partial \Omega_x : n_x(x) \cdot v < 0 \},
\]

where \( n_x(x) \) is the outward unit normal to \( \partial \Omega_x \) at the point \( x \in \partial \Omega_x \). We assume that a solution \( \bar{f} \) of (2.2) exists on the time interval \([0, T]\).

Observe that Poisson equation (2.3) is considered in the whole space \( \mathbb{R}^n \) (\( x \in \mathbb{R}^n \)). Thus we may first solve \( \phi \) as in Section 1 and then take the restriction of this \( \phi \) to \( \Omega_x \times [0, T] \) in (2.2).

Remark 2.1: The condition (2.1) implies that for \( T > 0 \) there is a constant \( C \) such that \( f(x, v, t) = 0 \) for \( |v| \geq C, x \in \Omega_x, t \in [0, T] \). For the analysis of the original problem (1.4) if we assume that \( f \) is compactly supported in \( \mathbb{R}^n \times \mathbb{R}^n \), then taking \( \Omega \) large enough, both \( \Omega_x \) and \( \Omega_v \) can be assumed to be bounded and zero boundary condition may be imposed, see [3]. The analysis of this case is included in our case below if all boundary integrals are dropped. □
Introducing the notation

$$\nabla f := (\nabla_x f, \nabla_v f) = \left( \frac{\partial f}{\partial x_1}, \ldots, \frac{\partial f}{\partial x_n}, \frac{\partial f}{\partial v_1}, \ldots, \frac{\partial f}{\partial v_n} \right), \quad n = 1, 2, 3$$

$$G(f) := (v, -\nabla_x \phi) = \left( v_1, \ldots, v_n, -\frac{\partial \phi}{\partial x_1}, \ldots, -\frac{\partial \phi}{\partial x_n} \right) = (G_1, \ldots, G_{2n}),$$

(2.2) can be rewritten as

$$\begin{align*}
\begin{bmatrix}
\frac{\partial f}{\partial t} + G(f) \cdot \nabla f = 0, & \text{in } \Omega \times I = Q_T, \\
0, & \text{on } \Gamma_x, \\
f(x, v, 0) = f_0(x, v), & \text{in } \Omega,
\end{bmatrix}
\end{align*}$$

(2.4)

where $I := [0, T]$, $G(f) = (v, -\nabla_x \phi)$ and $\phi$ satisfies (2.3). Note that

$$\text{div } G(f) = \sum_{i=1}^{n} \frac{\partial G_i}{\partial x_i} + \sum_{i=n+1}^{2n} \frac{\partial G_i}{\partial v_{i-n}} = 0, \quad n = 1, 2, 3.$$  

(2.5)

We now introduce a finite element structure on $\Omega_x \times \Omega_v$. Let $T^x_h = \{\tau_x\}$ and $T^v_h = \{\tau_v\}$ be finite element subdivisions of $\Omega_x$ with elements $\tau_x$ and $\Omega_v (= R^n)$ with elements $\tau_v$, respectively. Then $T_h = T^x_h \times T^v_h = \{\tau_x \times \tau_v\} = \{\tau\}$ will be a subdivision of $\Omega = \Omega_x \times \Omega_v$ with $\tau = \tau_x \times \tau_v$ as elements. Moreover we let $0 = t_0 < t_1 < \cdots < t_M = T$ be a subdivision of the time interval $I = [0, T]$ into sub-intervals $I_m = (t_m, t_{m+1}), m = 0, 1, \ldots, M - 1$. Further let $\mathcal{E}_h$ be the corresponding subdivision of $Q_T = \Omega \times [0, T]$ into elements $K = \tau \times I_m$, with $h = \text{diam } K$ as the mesh parameter and $P_k(K) = P_k(\tau_x) \times P_k(\tau_v) \times P_k(I_m)$ the set of polynomials in $x$, $v$ and $t$ of degree at most $k$ on $K$.

Given a domain $Q$ we denote by $(\cdot, \cdot)_Q$ the usual $L_2(Q)$ scalar product and $\| \cdot \|_Q$ the corresponding norm. $H^s(Q)$, for $s$ a positive integer, will denote the usual Sobolev space with norm $\| \cdot \|_{s, Q}$. Further for piecewise polynomials $w_i$ defined on the triangulation $\mathcal{E}_h' = \{K\}$ where $\mathcal{E}_h' \subset \mathcal{E}_h$ and for $D_i$ some differential operators, we use the notation

$$(D_1 w_1, D_2 w_2)_{Q'} = \sum_{K \in \mathcal{E}_h} (D_1 w_1, D_2 w_2)_K, \quad Q' = \bigcup_{K \in \mathcal{E}_h} K.$$

Finally, $C$ denotes a positive constant subject to change without notice.
3. THE STREAMLINE DIFFUSION METHOD

3.1. Stability

The streamline diffusion method is a finite element method for convection dominated convection-diffusion problems which (i) is higher order accurate and (ii) has good stability properties. The method was introduced by Hughes and Brooks [12] in the case of stationary problems. The mathematical analysis of this method was begun in Johnson [14] and Johnson and Nävert [15], and was continued in Johnson, Nävert and Pitkäranta [16] and Nävert [21], where also the method was extended to time dependent problems. SD (streamline diffusion)-method for two-dimensional time-dependent incompressible Euler and Navier-Stokes equations are studied in Johnson and Saranen [17]. Computational results for the cases considered in [17] are given in Hansbo [10]. Applications of the SD-method to Burgers' equation together with computational results are given in Johnson and Szepessy [18].

In this section we consider the SD-method for the Vlasov-Poisson equation (2.4), with the trial functions being continuous in the $x$ and $v$ variables. Since $f_0$ has compact support in $\Omega_v = R^n$ we have $f(x, v, t) = 0$ for $v$ large and thus the analysis can be restricted to a bounded domain $\Omega_v^h$ with all SD-test functions vanishing on $\partial \Omega_v^h$. We shall also use the following notation: for $k = 0, 1, 2, \ldots$, let

$$V_h = \{ g \in H_0^1; \ g \big|_K \in P_k(\tau) \times P_k(I_m); \ \forall K = \tau \times I_m \in \mathcal{C}_h \} ,$$

where

$$H_0^1 = \prod_{m=0}^{M-1} H_0^1(S_m), \quad S_m = \Omega \times I_m, \quad m = 0, 1, \ldots, M - 1.$$

and

$$H_0^1 = \{ g \in H^1; \ g \equiv 0 \text{ on } \partial \Omega_v^h \} .$$

Further we write

$$(f, g)_m = (f, g)_m, \quad \| g \|_m = (g, g)_m^{1/2},$$

and

$$\langle f, g \rangle_m = \langle f(\cdot, \cdot, t_m), g(\cdot, \cdot, t_m) \rangle_\Omega, \quad | g |_m = \langle g, g \rangle_m^{1/2}.$$

Also

$$[g] = g^+ - g^-.$$
where
\[ g_\pm = \lim_{s \to 0^\pm} g(x, v, t + s), \quad \text{for} \quad (x, v) \in \text{Int } \Omega_x \times \Omega_v^h, \quad t \in I, \]
\[ g_\pm = \lim_{s \to 0^\pm} g(x + sv, v, t + s), \quad \text{for} \quad (x, v) \in \partial \Omega_x \times \Omega_v^h, \quad t \in I, \]
and
\[ \langle f_+, g_+ \rangle_{\Gamma^-} = \int_{\Gamma^-} f_+ g_+ G^h \cdot n \, d\sigma, \]
\[ \langle f_+, g_+ \rangle_{\Gamma^m} = \int_{\Gamma^m} \langle f_+, g_+ \rangle_{\Gamma^-} \, ds, \]
\[ \langle f_+, g_+ \rangle_{\Gamma^-} = \int_f \langle f_+, g_+ \rangle_{\Gamma^-} \, ds, \]
with \( G^h = G(f^h) \) defined in (3.1) below and
\[ \Gamma_- = \{ (x, v) \in \Gamma = \partial (\Omega_x \times \Omega_v^h) : G^h \cdot n < 0 \}, \]
where \( n = (n_x, n_v) \) with \( n_x \) and \( n_v \) being outward unit normals to \( \partial \Omega_x \) and \( \partial \Omega_v^h \) respectively. Finally in this section \( \Omega = \Omega_x \times \Omega_v^h \).

The streamline diffusion method for (2.4) can now be formulated as follows: find \( f^h \in V_h \) such that for \( m = 0, 1, \ldots, M - 1 \).

\[ (f^h + G(f^h) \cdot \nabla f^h, g + h (g_t + G(f^h) \cdot \nabla g))_m + \]
\[ + \langle f^h, g_+ \rangle_m - \langle f^h, g_+ \rangle_{\Gamma^m} = \langle f^h, g_+ \rangle_m, \quad \forall g \in V_h, \]
where \( G(f^h) = (v, - \nabla_x \phi^h) \) and \( \phi^h \) satisfies the Poisson equation (2.3) with \( f \) replaced by \( f^h \), i.e.,

\[ - \Delta_x \phi^h = \int_{R^n} f^h(x, v, t) \, dv, \quad (x, t) \in R^n \times I = \Omega_T, \]
\( \nabla_x \phi^h \) is uniformly bounded and \( \nabla_x \phi^h \to 0 \) as \( |x| \to \infty \),
and \( f^h(x, v, 0) = f_0(x, v) \).

We introduce the notation

\[ B(G(f^h); f, g) = \sum_{m=0}^{M-1} \left[ (f_t + G(f^h) \cdot \nabla f, g + h (g_t + G(f^h) \cdot \nabla g))_m \right. \]
\[ - \langle f^h, g_+ \rangle_{\Gamma^m} + \sum_{m=1}^{M-1} \langle [f], g_+ \rangle_m + \langle f^h, g_+ \rangle_0, \]
\[ L(g) = \langle f_0, g_+ \rangle_0. \]
Observe the $f^h$ dependence of $B$ in the first term on the right hand side of (3.3). The problem (3.1) can now be more concisely formulated as follows: find $f^h \in V_h$ such that

\begin{equation}
B(G(f^h) ; f^h, g) = L(g), \quad \forall g \in V_h,
\end{equation}

where $G(f^h) = (v, -\nabla_x \phi^h)$ and $\phi^h$ satisfies (3.2).

We shall use a stability estimate for (3.4) in a norm $\| \cdot \|$ defined by

\begin{equation}
\| g \|^2 = \frac{1}{2} \left[ |g|^2_M + |g|^2_0 + \sum_{m=1}^{M-1} |[g]|^2_m + 2 h \| g \|_{Q_T}^2 + \int_{\partial \Omega \times I} g^2 |G^h \cdot n| \, d\sigma \, ds \right].
\end{equation}

**Lemma 3.1:** We have

\[ B(G(f^h) ; g, g) = \| g \|^2, \quad \forall g \in H_0. \]

**Proof:** Using the definition of $B$ we have

\begin{equation}
B(G(f^h) ; g, g) = (g_t, g)_{Q_T} + (G(f^h) \cdot \nabla g, g)_{Q_T} + h \| g_t + G(f^h) \cdot \nabla g \|^2_{Q_T}
+ \sum_{m=1}^{M-1} \langle [g], g_+ \rangle_m + \langle g_+, g_+ \rangle_0 - \langle g_+, g_+ \rangle_{\Gamma^-}.
\end{equation}

Integrating by parts we get

\begin{equation}
(g_t, g)_{Q_T} + \sum_{m=1}^{M-1} \langle [g], g_+ \rangle_m + \langle g_+, g_+ \rangle_0 = \frac{1}{2} \left[ |g|^2_M + |g|^2_0 + \sum_{m=1}^{M-1} |[g]|^2_m \right].
\end{equation}

Using Green’s formula

\[ (G(f^h) \cdot \nabla g, g)_{\Omega} = \int_{\partial \Omega} (G(f^h) \cdot n) \, g^2 \, d\sigma - (G(f^h) \cdot \nabla g, g)_{\Omega} + (\text{div} \, G(f^h) g, g)_{\Omega}, \]

and recalling (2.5) we have

\begin{equation}
(G(f^h) \cdot \nabla g, g)_{\Omega} - \langle g_+, g_+ \rangle_{\Gamma^-} = \frac{1}{2} \int_{\partial \Omega} g^2 (G(f^h) \cdot n) \, d\sigma - \int_{\Gamma^-} g^2 (G(f^h) \cdot n) \, d\sigma
= \frac{1}{2} \int_{\partial \Omega} g^2 |G(f^h) \cdot n| \, d\sigma.
\end{equation}

Now the proof follows by (3.5)-(3.7).
LEMMA 3.2: For any constant $C_1 > 0$, we have for $g \in \mathcal{H}_0$,
\[
\|g\|_{Q_T}^2 \leq \left[ \frac{1}{C_1} \|g_t + G(f^h) \cdot \nabla g\|_{Q_T}^2 + \sum_{m=1}^{M} |g^-|^2_m + \int_{\partial \Omega \times I} g^2 |G^h \cdot n| \, d\sigma \, ds \right] e^{C_1 h}.
\]

Proof: For $t_m < t < t_{m+1}$, we have using (3.7)
\[
\|g(t)\|_{\Omega}^2 = |g^-|^2_{m+1} - \int_{t_m}^{t_{m+1}} \frac{d}{dt} \|g(s)\|_{\Omega}^2 \, ds
\]
\[
= |g^-|^2_{m+1} - 2 \int_{t_m}^{t_{m+1}} \left[ (g_t + G(f^h) \cdot \nabla g, g)_{\Omega} - \frac{1}{2} \int_{\partial \Omega} g^2 |G^h \cdot n| \, d\sigma - \langle g_+, g_+ \rangle_{L^2} \right] ds
\]
\[
\leq |g^-|^2_{m+1} + \frac{1}{C_1} \|g_t + G(f^h) \cdot \nabla g\|_{m+1}^2 + \int_{\partial \Omega \times I_m} g^2 |G^h \cdot n| \, d\sigma \, ds + C_1 \int_{t_m}^{t_{m+1}} \|g(s)\|_{\Omega}^2 \, ds.
\]
Thus by Grönwall’s inequality for $t_m < t < t_{m+1}$,
\[
\|g(t)\|_{\Omega}^2 \leq \left[ \frac{1}{C_1} \|g_t + G(f^h) \cdot \nabla g\|_{m+1}^2 + \int_{\partial \Omega \times I_m} g^2 |G^h \cdot n| \, d\sigma \, ds \right] e^{C_1 h}.
\]

Integrating over $t_m < t < t_{m+1}$ and summing over $m = 0, \ldots, M - 1$, we obtain the desired result. □

LEMMA 3.3 (EXISTENCE THEOREM): For any $h > 0$ the problem (3.4) admits at least one solution.

The proof is similar to that of Lemma 2.4 in [17], where a Brouwer’s type fixed point theorem as in [19] is used. □

3.2. Error estimates

Let $\tilde{f}^h \in V_h$ be an interpolant of the exact solution $f$ and set $\eta = f - \tilde{f}^h$ and $\xi = f^h - \tilde{f}^h$. Then we have
\[
\epsilon := f - f^h = (f - \tilde{f}^h) - (f^h - \tilde{f}^h) = \eta - \xi.
\]

Our main result is
THEOREM 3.1: If \( f^h \in V_h \) satisfies (3.4) and the exact solution \( f \) of (2.4) satisfies
\[
\| \nabla f \|_\infty + \| G(f) \|_\infty + \| \nabla \eta \|_\infty + \| f \|_{k+1, Q_T} \leq C,
\]
then there is a constant \( C \) such that
\[
\| f - f^h \| \leq Ch^{k + \frac{1}{2}}.
\]

Proof: Since \( f \) satisfies (2.4) we have for \( g \in V_h \),
\[
B(G(f); f, g) = L(g),
\]
so that by (3.4) and Lemma 3.1
\[
\| \xi \|^2 = B(G(f^h); f^h - \tilde{f}^h, \xi) = L(\xi) - B(G(f^h); \tilde{f}^h, \xi) = B(G(f); f, \xi) - B(G(f^h); f - \eta, \xi) = T_1 + T_2,
\]
where
\[
T_1 = B(G(f^h); \eta, \xi)
\]
\[
T_2 = B(G(f); f, \xi) - B(G(f^h); f, \xi).
\]

We now estimate \( T_1 \) and \( T_2 \) separately. Integrating by parts, using (2.5) and the same argument as in the proof of Lemma 3.1 we find that
\[
\left| T_1 \right| = \left| - (\eta, \xi_f + G(f^h) \cdot \nabla \xi)_{Q_T} + \left( \eta_-, \xi_- \right)_{M} - \sum_{m=1}^{M} \left( \eta_-, [\xi] \right)_{m} + \int_{\partial \Omega \times I} \eta \xi |G^h| \cdot n \, d\sigma \, ds + h (\eta_t + G(f^h) \cdot \nabla \eta, \xi_t + G(f^h) \cdot \nabla \xi)_{Q_T} \right|
\]
\[
\leq \frac{1}{8} \| \xi \|^2 + C \left[ \int_{\partial \Omega \times I} \eta^2 |G^h| \cdot n \, d\sigma \, ds + h^{-1} \| \eta \|^2_{Q_T} + \sum_{m=1}^{M} |\eta_-|^2_m + h \| \eta_t + G(f^h) \cdot \nabla \eta \|^2_{Q_T} \right]
\]
where we have also used the fact that \( f \) and \( f^h \) and consequently \( \eta \) and \( \xi \) have compact support in \( \Omega^h \). Moreover since \( \Omega_x \) is bounded there exists \( r > 0 \), such that \( \Omega_x \subseteq \{ x \in \mathbb{R}^n : |x| < r \} \). Using (3.2) with
\[
\int_{\Omega^h_x} f(x, v, t) \, dv = \rho(x, t) \quad \text{and} \quad \left( \frac{x-y}{|x-y|} \right)^n \rho(y, t) \, dy = CK' \rho,
\]
\[\text{M3AN Modélisation mathématique et Analyse numérique} \]
\[\text{Mathematical Modelling and Numerical Analysis} \]
where

\[ K'(z) = \frac{z}{|z|^n}, \quad z \in D \subset \{ x \in \mathbb{R}^n, |x| < 2r \}. \]

Using Young's inequality

\[ \| \nabla_x \phi \|_{\Omega_T} = \| \nabla_x \phi \|_{L_2(\Omega_T)} \leq C \| K' \|_{L_1(D)} \| \rho \|_{L_2(\Omega_T)}, \]

we obtain

\[ \| \nabla_x \phi \|_{\Omega_T} \leq C \| \rho \|_{\Omega_T} \leq C \| f \|_{Q_T}. \]

Now, since \( f \) and \( f^h \) are compactly supported in \( \mathbb{R}^n \times \mathbb{R}^n \), \( (\Omega_v^h \text{ and } \Omega_x^h \text{ are bounded}) \) and

\[ G(f^h) - G(f) = -(0, 0, \ldots, 0, \nabla_x (f^h - f)), \]

we have

\[ (3.12) \quad \| G(f^h) - G(f) \|_{\Omega_T} \leq C \| f - f^h \|_{Q_T} \leq C \left( \| \xi \|_{Q_T} + \| \eta \|_{Q_T} \right), \]

and consequently

\[ (3.13) \quad \| \eta_t + G(f^h) \cdot \nabla \eta \|_{Q_T} \leq \]

\[ \leq \| \eta_t + G(f) \cdot \nabla \eta \|_{Q_T} + \| (G(f^h) - G(f)) \cdot \nabla \eta \|_{Q_T} \]

\[ \leq \| \eta_t \|_{Q_T} + \| G(f) \|_{\infty} \| \nabla \eta \|_{Q_T} + C \| \nabla \eta \|_{\infty} \left( \| \xi \|_{Q_T} + \| \eta \|_{Q_T} \right). \]

Next

\[ T_2 = \left( (G(f) - G(f^h)) \cdot \nabla f, \xi \right)_{Q_T} + \]

\[ + h((G(f) - G(f^h)) \cdot \nabla f, \xi_t + G(f^h) \cdot \nabla \xi)_{Q_T} \]

so that by (3.12),

\[ (3.14) \quad |T_2| \leq C \left( \| \xi \|_{Q_T} + \| \eta \|_{Q_T} \right) \| \nabla f \|_{\infty} \| \xi \|_{Q_T} + \]

\[ + C h \left( \| \xi \|_{Q_T} + \| \eta \|_{Q_T} \right)^2 \| \nabla f \|_{\infty}^2 + C h \| \xi_t + G(f^h) \cdot \nabla \xi \|_{Q_T}^2. \]

Estimating \( \| \xi \|^2_{Q_T} \) from Lemma 3.2 and hiding the terms as \( C h \| \xi_t + G(f^h) \cdot \nabla \xi \|_{Q_T}^2 \), \( \| \eta \|^2_{Q_T} \), in (3.14) in \( \| \xi \|^2 \), a combination of (3.9)-(3.11), (3.13), (3.14) and vol. 24, n° 2, 1990
Lemma 3.2 with $C_1$ large enough gives

$$\|\xi\|^2 \leq C \left[ \int_{\partial \Omega \times I} \eta^2 |G^h \cdot n| \, ds \, ds + h^{-1} \|\eta\|^2_{Q_T} + \sum_{m=1}^{M} |\eta_+|^2_m + h \|\eta\|^2_{Q_T} + \sum_{m=1}^{M} |\xi_-|^2_m h \right].$$

Finally, by standard interpolation theory we have (see e.g. Ciarlet [6], p. 123).

$$\left[ h \int_{\partial \Omega \times I} \eta^2 |G^h \cdot n| \, ds \, ds + \|\eta\|^2_{Q_T} + h \sum_{m=1}^{M} |\eta_+|^2_m + h^2 \|\eta\|^2_{Q_T} \right]^{1/2} \leq C h^{k+1} \|f\|_{k+1, Q_T}.$$

Thus by (3.9)

$$\|\xi\|^2 \leq C h^{2k+1} + C_1 \sum_{m=1}^{M} |\xi_-|^2_m h.$$  

We shall now use the following discrete Grönwall's estimate. If

$$y(\cdot, t_m) \leq C + C_1 \sum_{j \leq m} |y(\cdot, t_j)| \, h,$$

then

$$y(t_m) \leq C \, e^{C_1 t} \leq C \, e^{C_1 T}.$$  

This is an analogue of the following continuous Grönwall's estimate. If

$$y(t) \leq C + C_1 \int_0^t y(s) \, ds,$$

then

$$y(t) \leq C \, e^{C_1 t}.$$  

Obviously (3.15) implies that

$$|\xi_-|^2_m \leq C h^{2k+1} + C_1 \sum_{m=1}^{M} |\xi_-|^2_m h,$$

so that using (3.16)

$$|\xi_-|_m^2 \leq C h^{2k+1} e^{C_1 T}.$$  

\[\text{M2AN Modélisation mathématique et Analyse numérique}\]

\[\text{Mathematical Modelling and Numerical Analysis}\]
By (3.15) and (3.17)
\[ \| \xi \| ^2 \leq Ch^{2k+1} + C_1 \sum_{m=1}^{M} (Ch^{2k+1} e^{C_1 T}) h = C(T) h^{2k+1} \]
where
\[ C(T) = C e^{C_1 T}. \]

Recalling that the interpolation error is of the order \( h^{k+1/2} \) the proof of Theorem 3.1 is complete. \( \square \)

A uniqueness result for the Vlasov-Poisson equation is obtained in a similar way as for the Euler equation in [17]. \( \square \)

4. DISCONTINUOUS GALERKIN

In this section we use trial functions which may be discontinuous across interelement boundaries also in the space and velocity variables.

To define a finite element method using discontinuous trial functions we introduce the following notation: if \( \beta = (\beta_1, \beta_2, \ldots, \beta_{2n}) \), \( n = 1, 2, 3 \) is a given smooth vector field on \( Q_T \) we define for \( K \in \mathcal{K}_h \)
\[ \partial K_\pm (\beta) = \{ (x, v, t) \in \partial K : n_t(x, v, t) + n(x, v, t) \cdot \beta(x, v, t) \leq 0 \} \]
where \( (n, n_t) = (n_x, n_v, n_t) \) denotes the outward unit normal to \( \partial K \subset Q_T \). We also introduce for \( k \geq 0 \),
\[ W_h = \{ g \in L_2(Q_T) : g |_K \in P_k(K), \forall K \in \mathcal{K}_h \}. \]

The discontinuous Galerkin finite element method for (2.4) can now be formulated as follows: find \( f^h \in \mathcal{W}_h \) such that
\[ (f_t^h + \beta \cdot \nabla f^h, g + h (g_t + \beta \cdot \nabla g))_{Q_T} + \]
\[ + \sum_{K \in \mathcal{K}_h} \int_{\partial K_+ (\beta)} [f^h] g_+ |n_+ + n \cdot \beta| d\sigma = 0, \forall g \in \mathcal{W}_h \]
where \( \beta = G (f^h) = (v, -\nabla_x \phi^h) \), with \( \phi^h \) satisfying (3.2), \( f^h (x, v, 0) = f_0 (x, v) \) and \( [g] = g_+ - g_- \), with \( g_\pm = \lim_{s \to 0^\pm} g ((x, v) + G (f^h) s, t + s). \)

Recall that since \( \beta \) is divergence free, \( \beta \cdot n = G (f^h) \cdot n \) is continuous across the interelement boundaries of \( \mathcal{K}_h \) and thus \( \partial K_\pm (\beta) \) is well defined.
To write (4.2) on more compact form we introduce the notation

\begin{equation}
B(G;f,g) = (f + G \cdot \nabla f, g + h (g + \beta \cdot \nabla g))_{Q_T} + \\
+ \sum_{\lambda K_-(\beta')} [f] g_+ |n_+ + n \cdot \beta| \, d\sigma + \langle f_+, g_+ \rangle_0
\end{equation}

and

\[ L(g) = \langle f_0, g_+ \rangle_0, \]

where \( \partial K_-(\beta)' = \partial K_-(\beta) \setminus \Omega \times \{0\} \). Then (4.2) can be written in the following form: find \( f^h \in W_h \) such that

\begin{equation}
B(G(f^h);f^h, g) = L(g), \quad \forall g \in W_h.
\end{equation}

This method is analyzed in a similar way to the SD-method and in particular we have the following analogues of Lemmas 3.1 and 3.2.

**Lemma 4.1:** We have with \( \beta = G(f^h) \) and \( B \) defined by (4.3)

\[ B(G(f^h);g,g) = \| g \|^2 \quad \forall g \in W_h \]

where

\begin{equation}
\| g \|^2 = \frac{1}{2} \left[ |g|^2_M + |g|^2_0 + \sum_{\lambda K_-(\beta')} [g]^2 |n_+ + n \cdot \beta| \, d\sigma + \\
+ 2h \| g_+ + \nabla g \|^2_{Q_T} + \int_{\partial \Omega_+ \times I} g^2 |n \cdot \beta| \, d\sigma \right].
\end{equation}

The proof is similar to that of Lemma 3.1 using here the equality

\[ \sum_{\lambda K_-(\beta')} \left[ (g_+, g)_K + (\beta \cdot \nabla g, g)_K + \int_{\partial K_-(\beta')} [g] g_+ |n_+ + n \cdot \beta| \, d\sigma \right] + |g|^2_0 = \]

\[ = \frac{1}{2} \left[ |g|^2_M + |g|^2_0 + \sum_{\lambda K_-(\beta')} [g]^2 |n_+ + n \cdot \beta| \, d\sigma + \\
+ \int_{\partial \Omega_+ \times I} g^2 |n \cdot \beta| \, d\sigma \right]. \quad \square \]

**Lemma 4.2:** For any constant \( C_1 > 0 \) we have for \( \beta = G(f^h) \) and \( g \in W_h \)

\[ \| g \|^2_{Q_T} \leq \left[ \frac{1}{C_1} \| g_+ + \nabla g \|^2_{Q_T} + \sum_{m=1}^N |g_+|^2_m + \sum_{\lambda K_-(\beta')} [g]^2 |n_+ + n \cdot \beta| \, d\sigma + \\
+ \int_{\partial \Omega_+ \times I} g^2 |n \cdot \beta| \, d\sigma \right] h e^{C_1 h}, \]
where
\[ \partial K_- (\beta)'' = \{(x, v, t) \in \partial K_- (\beta)' : n_i(x, v, t) = 0\} . \]

**Proof:** We have for \( t_m < t < t_{m+1}, K = \tau \times I_m, \)
\[
\| g(t) \|^2 = \| g_- \|^2_{m+1,\tau} - \int_{t}^{t_{m+1}} \| g(s) \|^2_{\tau} ds = \| g_- \|^2_{m+1,\tau} - 2 \int_{\tau}^{t_{m+1}} (g_t + \beta \cdot \nabla g, g)_\tau - \int_{\partial \Omega} g^2 n \cdot \beta \, d\sigma - \frac{1}{2} \int_{\partial \tau} g^2 |n \cdot \beta| \, d\sigma,
\]
where \( |g_-|_{m+1,\tau} \) is the obvious restriction of \( |g_-|_{m+1} \) to \( \tau \). Summing over \( \tau \in T \), we obtain
\[
\| g(t) \|^2 = \| g_- \|^2_{m+1} - 2 \int_{\tau}^{t_{m+1}} (g_t + \beta \cdot \nabla g, g)_\Omega + \sum_k \int_{\partial K_- (\beta)'' \cap \{(s : t < s < t_{m+1})\}} [g]^2 |n \cdot \beta| \, d\sigma + \int_{\partial K_- (\beta)'' \cap I_m} g^2 |n \cdot \beta| \, d\sigma \leq \| g_- \|^2_{m+1} + \frac{1}{C_1} \| g_t + \beta \cdot \nabla g \|^2_m + C_1 \int_{\tau}^{t_{m+1}} \| g(s) \|^2_{\Omega} + \sum_k \int_{\partial K_- (\beta)'' \cap I_m} [g]^2 |n \cdot \beta| \, d\sigma + \int_{\partial K_- (\beta)'' \cap I_m} g^2 |n \cdot \beta| \, d\sigma.
\]
Now using Grönwall’s inequality we find that
\[
\| g(t) \|^2_{\Omega} \leq \left[ \| g_- \|^2_{m+1} + \frac{1}{C_1} \| g_t + \beta \cdot \nabla g \|^2_m + \sum_k \int_{\partial K_- (\beta)'' \cap I_m} [g]^2 |n \cdot \beta| \, d\sigma + \int_{\partial K_- (\beta)'' \cap I_m} g^2 |n \cdot \beta| \, d\sigma \right] e^{C_1 h}.
\]
Integration over \( I_m \) and summation for \( m = 0, \ldots, M - 1 \), complete the proof. \( \Box \)

**THEOREM 4.1:** Let \( f \) and \( f^h \) be as in Theorem 3.1 and \( \| f \|_{k+1,\infty} \leq C \), then we have the following error estimate for the problem (4.2),
\[
\| f - f^h \| \leq C h^{k + \frac{1}{2}}
\]
vol. 24, n° 2, 1990
where \( \| \cdot \|_{k+1, \infty} \) denotes the \( W_{\infty}^{k+1}(\Omega_T) \)-norm.

Proof: We have as in the proof of Theorem 3.1,
\[
\| \xi \|_2^2 = B(G(f^h) ; \eta, \xi) + [B(G(f) ; f, \xi) - B(G(f^h) ; f, \xi)] = T_1 + T_2
\]
where \( \xi \) and \( \eta \) are the same as in Section 3. Integration by parts in the term \( T_1 \) leads to appearance of a term of the form
\[
T_3 = \sum_k \int_{\partial K_-(\beta)^*} [\xi] \eta_+ | n \cdot \beta | \, d\sigma,
\]
where \( \beta = G(f^h) \). Using Cauchy’s inequality we have for \( \delta > 0 \)
\[
|T_3| \leq \frac{C}{\delta} \sum_k \int_{\partial K_-(\beta)^*} |\eta_+|^2 | n \cdot \beta | \, d\sigma + C\delta \sum_k \int_{\partial K_-(\beta)^*} [\xi]^2 | n \cdot \beta | \, d\sigma.
\]
Here the last sum can be hidden in \( \| \xi \|_2^2 \), and we estimate the first one as follows
\[
(4.6) \quad \sum_k \int_{\partial K_-(\beta)^*} |\eta_+|^2 | n \cdot \beta | \, d\sigma \leq \\
\leq \| \eta \|_\infty^2 \sum_k \left[ \int_{\partial K_-(\beta)^*} | n \cdot \beta |^2 \, ds + \int_{\partial K_-(\beta)^*} \, d\sigma \right] \\
= C \| \eta \|_\infty^2 \sum_k [C h^{-1} \| \beta \|_K^2 + C h^2 n], \quad n = 1, 2, 3.
\]
Here we have used the fact that
\[
\int_{\partial K} |g \cdot n|^2 \, d\sigma \leq C h^{-1} \int_K g^2 \, dy, \quad \forall g \in P_k(K).
\]
Now by (3.12) we have
\[
(4.7) \quad \| \beta \|_{Q_T} = \| G(f^h) \|_{Q_T} \leq C (\| \xi \|_{Q_T} + \| \eta \|_{Q_T}) + \| G(f) \|_{Q_T}.
\]
Moreover the interpolation error \( \eta \) satisfies
\[
(4.8) \quad \| \eta \|_\infty = \| f - \tilde{f}^h \|_\infty \leq C h^{k+1} \| f \|_{k+1, \infty}.
\]
Thus (4.6)-(4.8) imply that
\[
|T_3| \leq \frac{1}{\delta} \| \xi \|_2^2 + C h^{2k+2} \| f \|_{k+1, \infty}^2 \times \\
\times [h^{-1}(\| \xi \|_{Q_T}^2 + \| \eta \|_{Q_T}^2 + \| G(f) \|_{Q_T}^2) + h^2 n]
\]

\( \text{M\&AN Modélisation mathématique et Analyse numérique} \)
\( \text{Mathematical Modelling and Numerical Analysis} \)
and by the assumption of the theorem

$$|T_3| \leq C h^{2k+1} + \frac{1}{8} \| \xi \| ^2.$$  

The remaining terms are estimated by similar arguments as in the proof of Theorem 3.1 and the proof is complete. □

ACKNOWLEDGMENT

I am grateful to Professor Claes Johnson for introducing me to the subject of this paper and for his encouragement to this work.
