## 1. Introduction and Notations

Let $W$ denote a $d$-dimensional standard Wiener process, $\sigma: \mathbb{R}^{m} \longrightarrow \mathbb{R}^{m} \otimes \mathbb{R}^{d}$ and $b: \mathbb{R}^{\boldsymbol{m}} \longrightarrow \mathbb{R}^{\boldsymbol{m}}$ satisfy the following condition
(H) $\sigma$ is of class $\mathcal{C}^{2}$, bounded together with its partial derivative of order one and two, and $b$ is globally Lipschitz and bounded.
For any $x \in \mathbb{R}^{m}$, let $\left(X_{t}, t \in[0,1]\right)$ be the diffusion solution of the stochastic differential equation

$$
\begin{equation*}
X_{t}=x+\int_{0}^{t} \sigma\left(X_{s}\right) d W_{s}+\int_{0}^{t} b\left(X_{s}\right) d s \tag{1.1}
\end{equation*}
$$

Let $\alpha>0$, and denote by $\mathcal{C}^{\alpha}\left([0,1] ; \mathbb{R}^{m}\right)$ the set of $\alpha$-Hölder continuous functions, i.e., of continuous functions $f:[0,1] \longrightarrow \mathbb{R}^{m}$ such that

$$
\begin{equation*}
\|f\|_{\alpha}=\sup _{t}|f(t)|+\sup _{s \neq t} \frac{|f(t)-f(s)|}{|t-s|^{\alpha}}<\infty . \tag{1.2}
\end{equation*}
$$

The norm $\|\cdot\|_{\alpha}$ is called the $\alpha$-Hölder norm. It is well known that the trajectories of $X$ are $\alpha$-Hölder continuous for $\alpha \in\left[0, \frac{1}{2}[\right.$.

[^0]Let $\mathcal{H}$ denote the Cameron-Martin space, and given $h \in \mathcal{H}$ let $S(h)$ be the solution of the differential equation

$$
\begin{equation*}
S(h)_{t}=x+\int_{0}^{t} \sigma\left[S(h)_{s}\right] \dot{h}_{s} d s+\int_{0}^{t}\left[b\left(S(h)_{s}\right)-\frac{1}{2}(\nabla \sigma) \sigma\left(S(h)_{s}\right)\right] d s \tag{1.3}
\end{equation*}
$$

The aim of this paper is to give a simple proof of the characterization of the support of $P \circ X^{-1}$ as the closure $\mathcal{S}$ of the set $\{S(h) ; h \in \mathcal{H}\}$ in $\mathcal{C}^{\alpha}\left([0,1] ; \mathbb{R}^{\boldsymbol{m}}\right)$. This characterization has been shown by Ben Arous, Gradinaru and Ledoux ([2], [3]) using the approximative continuity property - first introduced by Stroock and Varadhan [9] in the case of the norm of uniform convergence - and by Aida, Kusuoka and Stroock [1] by means of a sequence of non absolutely continuous transformations of $\Omega$.

In the setting of stochastic differential equations driven by general semimartingales and for the uniform topology, Mackevičius [7], Gyöngy and Pröhle [5] have introduced families of probabilities $P^{\delta} \ll P$ connected with mollifiers, to conclude that the support $P \circ X^{-1}$ contains $\mathcal{S}$. Their approach relies on general convergence results of semimartingales under $P^{\delta}$.

The idea of the method presented here consists in reducing both inclusions of the support to approximations of the diffusion using adapted linear interpolations $\omega^{n}$ of $\omega$. Thus we check that $\left\|S\left(\omega^{n}\right)-X\right\|_{\alpha}$ and $\left\|X\left(\omega-\omega^{n}+h\right)-S(h)\right\|_{\alpha}$ converge to zero in $L^{2}$. Since the law of the transformation $T_{n}$ of $\Omega$ defined by $T_{n}(\omega)=\omega-\omega^{n}+h$ is absolutely continuous with respect to $P$ (by Girsanov's theorem), the second convergence yields that the support of $P \circ X^{-1}$ contains $\mathcal{S}$, while the first one provides the converse inclusion in the usual way.

The method is used in [8] for stochastic hyperbolic partial differential equations. In order to stress the method and avoid technical arguments, we suppose that the coefficients $\sigma$ and $b$ are bounded.

We will use the following notational convention: sums on repeated indices are omitted, and constants appearing in the proof are denoted by $C$, eventhough they may change from one line to the next one.

## 2. Preliminaries

In this section we state criteria of convergence in Hölder norms and a general theorem characterizing the support of the law of a Wiener functional. The following theorem is a consequence of the Garsia-Rodemich-Rumsey lemma (see e.g. [11], p. 60).

Proposition 2.1. (i) Let $\left(Y_{n}(t), t \in[0,1]\right)$ be a sequence of $\mathbb{R}^{m}$-valued processes such that
(A1) For every $p \in[1, \infty)$ there exists $C$ such that

$$
\sup _{n} E\left(\left|Y_{n}(t)-Y_{n}(s)\right|^{2 p}\right) \leq C|t-s|^{p}
$$

for every $s, t \in[0,1]$.
Then, for any $\lambda>0$ and $\beta<\frac{p-1}{2 p}$, there exists $C>0$ such that

$$
\begin{equation*}
\sup _{n} P\left(\sup _{s \neq t} \frac{\left|Y_{n}(t)-Y_{n}(s)\right|}{|t-s|^{\beta}}>\lambda\right) \leq C \lambda^{-2 p} \tag{2.1}
\end{equation*}
$$

(ii) Let $\left(Y_{n}(t), t \in[0,1]\right)$ be a sequence of $\mathbb{R}^{m}$-valued processes such that (A1) and the following assumption (A2) is satisfied:
(A2) For any $\varepsilon>0$,

$$
\lim _{n \rightarrow \infty} P\left(\sup _{0 \leq i \leq 2^{n}}\left|Y_{n}\left(i 2^{-n}\right)\right|>\varepsilon\right)=0
$$

Then, for any $\alpha \in\left[0, \frac{1}{2}[\right.$ one has that

$$
\lim _{n} P\left(\left\|Y_{n}\right\|_{\alpha}>\varepsilon\right)=0
$$

## Sketch of proof

Part (i) is a simple consequence of the Garsia-Rodemich-Rumsey lemma
(ii) Approximating $Y_{n}(t)$ by $Y_{n}\left({\underset{\sim}{t}}_{n}\right)$, where ${\underset{\sim}{t}}_{n}$ denotes the greatest dyadic point less than $t$, and using (2.1) we obtain that

$$
P\left(\sup _{t}\left|Y_{n}(t)\right|>\varepsilon\right) \leq P\left(\sup _{i}\left|Y_{n}\left(i 2^{-n}\right)\right|>\frac{\varepsilon}{2}\right)+C \varepsilon^{-2 p} \cdot 2^{-2 p(n \beta-1)}
$$

Let $\alpha \in\left[0, \frac{1}{2}\left[, p>1, \delta>0\right.\right.$ be such that $\beta=\alpha+\delta<\frac{p-1}{2 p}$. Then, considering the cases $|s-t| \leq 2^{-m_{0}}$ and $|s-t|>2^{-m_{0}}$, we obtain that for every $n$,

$$
\begin{aligned}
& P\left(\sup _{t \neq s} \frac{\left|Y_{n}(t)-Y_{n}(s)\right|}{|t-s|^{\alpha}}>\varepsilon\right) \leq P\left(\sup _{|t-s|>2^{-m_{0}}} \frac{\left|Y_{n}(t)-Y_{n}(s)\right|}{|t-s|^{\alpha}}>\varepsilon\right) \\
&+P\left(\sup _{t \neq s} \frac{\left|Y_{n}(t)-Y_{n}(s)\right|}{|t-s|^{\beta}}>\varepsilon 2^{m_{0} \delta}\right) \\
& \leq 2 P\left(\sup _{t}\left|Y_{n}(t)\right|>\varepsilon 2^{-m_{0}-1}\right)+C \varepsilon^{-2 p} 2^{-2 m_{0} \delta p}
\end{aligned}
$$

Thus choosing $m_{0}$ large enough we conclude that

$$
\lim _{n} P\left(\sup _{s \neq t} \frac{\left|Y_{n}(t)-Y_{n}(s)\right|}{|t-s|^{\alpha}}>\varepsilon\right)=0 .
$$

We now state sufficient conditions for inclusions on the support of the law of a measurable map $F: \Omega \longrightarrow E$, where $(E,\| \|)$ is a separable Banach space; the proof is straightforward.

Proposition 2.2. Let $F: \Omega \longrightarrow E$ be measurable
(i) Let $\zeta_{1}: \mathcal{H} \longrightarrow E$ be a measurable map, and let $H_{n}: \Omega \longrightarrow \mathcal{H}$ be a sequence of random variables such that for any $\varepsilon>0$,

$$
\begin{equation*}
\lim _{n} P\left(\left\|F(\omega)-\zeta_{1}\left(H_{n}(\omega)\right)\right\|>\varepsilon\right)=0 \tag{2.2}
\end{equation*}
$$

Then

$$
\begin{equation*}
\text { support }\left(P \circ F^{-1}\right) \subset \overline{\zeta_{1}(\mathcal{H})} \tag{2.3}
\end{equation*}
$$

(ii) Let $\zeta_{2}: \mathcal{H} \longrightarrow E$ be a map, and for fixed $h$ let $T_{n}^{h}: \Omega \longrightarrow \Omega$ be a sequence of measurable transformations such that $P \circ\left(T_{n}^{h}\right)^{-1} \ll P$, and for any $\varepsilon>0$,

$$
\begin{equation*}
\underset{n}{\lim \sup } P\left(\left\|F\left(T_{n}^{h}(\omega)\right)-\zeta_{2}(h)\right\|<\varepsilon\right)>0 . \tag{2.4}
\end{equation*}
$$

Then support $\left(P \circ F^{-1}\right) \supset \overline{\zeta_{2}(\mathcal{H})}$.
Given a positive integer $n$, let $D_{n}$ denote the set of $n$-dyadic points, $D_{n}=$ $\left\{i 2^{-n} ; 0 \leq i \leq 2^{n}\right\}$. For $t \in[0,1], \frac{k}{2^{n}} \leq t<\frac{k+1}{2^{n}}$, set

$$
\begin{equation*}
{\underset{\sim}{n}}^{n}=\frac{k}{2^{n}}, \quad \underline{t}_{n}=\frac{k-1}{2^{n}} \vee 0, \tag{2.6}
\end{equation*}
$$

and let $W^{n}$ be the adapted linear interpolation of $\omega$ defined by

$$
\begin{equation*}
W_{t}^{n}=W_{\underline{t}_{n}}+2^{n}\left(t-t_{n}\right)\left[W_{t_{n}}-W_{\underline{t}_{n}}\right] . \tag{2.7}
\end{equation*}
$$

We consider the map $\zeta_{1}=\zeta_{2}=S(\cdot), H_{n}(\omega)=\omega^{n}$, and $T_{n}^{h}(\omega)=\omega-\omega^{n}+h$. Then Girsanov's theorem implies that $P \circ\left(T_{n}^{h}\right)^{-1}$ is absolutely continuous with respect to $P$.

Fix $\alpha<\frac{1}{2}$ and let $\left.\beta \in\right] \alpha, \frac{1}{2}\left[;\right.$ since $X .-x, X . o T_{n}^{h}-x, S .\left(\omega^{n}\right)-x$ and $S .(h)-x$ a.s. belong to $\mathcal{C}^{\beta}\left([0,1] ; \mathbb{R}^{m}\right)$ and have initial value 0 , using $[4]$ it is easy to see that they also belong to the separable Banach subspace $H_{0}^{\alpha}$ of $\mathcal{C}^{\alpha}\left([0,1] ; \mathbb{R}^{m}\right)$ defined by

$$
H_{0}^{\alpha}=\left\{f \in \mathcal{C}^{\alpha}\left([0,1] ; \mathbb{R}^{m}\right) ; f(0)=0,|f(t)-f(s)|=o\left(|t-s|^{\alpha}\right) \text { as }|t-s| \rightarrow 0\right\}
$$

Thus, by Proposition 2.2 the equality supp $P \circ X^{-1}=\mathcal{S}$ will follow from the following convergence results for every $\varepsilon>0$ :

$$
\begin{align*}
& \lim _{n} P\left(\left\|X(\omega)-S\left(\omega^{n}\right)\right\|_{\alpha}>\varepsilon\right)=0  \tag{2.8}\\
& \lim _{n} P\left(\left\|X\left(\omega-\omega^{n}+h\right)-S(h)\right\|_{\alpha}>\varepsilon\right)=0 . \tag{2.9}
\end{align*}
$$

Approximations of stochastic integrals by Riemann sums imply that $X^{n}(\omega):=$ $X\left(\omega-\omega^{n}+h\right)$ is solution of the stochastic differential equation

$$
\begin{align*}
X_{t}^{n}=x & +\int_{0}^{t} \sigma\left(X_{s}^{n}\right) d W_{s}-\int_{0}^{t} \sigma\left(X_{s}^{n}\right) \dot{\omega}_{s}^{n} d s+\int_{0}^{t} \sigma\left(X_{s}^{n}\right) \dot{h}_{s} d s \\
& +\int_{0}^{t} b\left(X_{s}^{n}\right) d s \tag{2.10}
\end{align*}
$$

while $S\left(\omega^{n}\right)$ satisfies

$$
\begin{equation*}
S\left(\omega^{n}\right)_{t}=x+\int_{0}^{t} \sigma\left(S\left(\omega^{n}\right)_{s}\right) \dot{\omega}_{s}^{n} d s+\int_{0}^{t}\left[b-\frac{1}{2}(\nabla \sigma) \sigma\right]\left(S\left(\omega^{n}\right)\right)_{s} d s \tag{2.11}
\end{equation*}
$$

Thus both processes ( $X_{.}^{n}$ ) and ( $S\left(\omega^{n}\right)$.) are particular cases of a diffusion $\left(Y^{n}\right)$ solution of the stochastic differential equation

$$
\begin{equation*}
Y_{t}^{n}=x+\int_{0}^{t} F\left(Y_{s}^{n}\right) d W_{s}+\int_{0}^{t} G\left(Y_{s}^{n}\right) \dot{\omega}_{s}^{n} d s+\int_{0}^{t} H\left(Y_{s}^{n}\right) \dot{h}_{s} d s+\int_{0}^{t} B\left(Y_{s}^{n}\right) d s \tag{2.12}
\end{equation*}
$$

where the coefficients $F, G, H$ and $B$ satisfy the condition:
(C) $F, G, H \mathbb{R}^{m} \longrightarrow \mathbb{R}^{m} \otimes \mathbb{R}^{d}$ are globally Lipschitz functions, $G$ is of class $\mathcal{C}^{2}$ with bounded partial derivatives, $B: \mathbb{R}^{m} \longrightarrow \mathbb{R}^{m}$ is globally Lipschitz.
Given the coefficients $F, G, H$ and $B$, let $\left(Z_{s}\right)$ be solution of the stochastic differential equation

$$
\begin{align*}
Z_{t}=x & +\int_{0}^{t}\left[F\left(Z_{s}\right)+G\left(Z_{s}\right)\right] d W_{s}+\int_{0}^{t} H\left(Z_{s}\right) \dot{h}_{s} d s+\int_{0}^{t} B\left(Z_{s}\right) d s \\
& +\int_{0}^{t} \nabla G\left(Z_{s}\right)\left[F\left(Z_{s}\right)+\frac{1}{2} G\left(Z_{s}\right)\right] d s . \tag{2.13}
\end{align*}
$$

Fix $\alpha \in\left[0, \frac{1}{2}[;\right.$ then conditions (2.8) and (2.9) are particular cases of the following convergences for every $\varepsilon>0$ :

$$
\begin{equation*}
\lim _{n} P\left(\left\|Y^{n}-Z\right\|_{\alpha}>\varepsilon\right)=0 \tag{2.14}
\end{equation*}
$$

Indeed, setting $F=0, G=\sigma, H=0$ and $B=b-\frac{1}{2}(\nabla \sigma) \sigma$ we obtain (2.8), while $F=\sigma, G=-\sigma, H=\sigma$ and $B=b$ yields (2.9).

It is well-known that for $s, t \in[0,1], p \in[1, \infty)$,

$$
E\left(\left|Z_{t}-Z_{s}\right|^{2 p}\right) \leq C|t-s|^{p}
$$

Thus, by Proposition 2.1, it suffices to check that for any $s, t \in[0,1], p \in[1, \infty)$,

$$
\begin{equation*}
\sup _{n} E\left(\left|Y_{t}^{n}-Y_{s}^{n}\right|^{2 p}\right) \leq C|t-s|^{p} \tag{2.15}
\end{equation*}
$$

and

$$
\begin{equation*}
\lim _{n} E\left(\sup _{0 \leq i \leq 2^{n}}\left|Y_{i 2^{-n}}^{n}-Z_{i 2^{-n}}\right|^{2}\right)=0 . \tag{2.16}
\end{equation*}
$$

## 3. Characterization of the support

In this section we at first check that the moment estimates (2.15) are true; the boundedness of $F, G, H$ and $B$ simplifies the argument. Once (2.15) is checked the proof of (2.16) does not use this boundedness any more.

Proposition 3.1. Let $F, G, H$ and $B$ be bounded coefficients satisfying condition (C), and let ( $Y_{s}^{n}$ ) be solution of (2.12). Then given $p \in[1, \infty)$, there exists a constant $C$ such that for every $s, t \in[0,1]$,

$$
\sup _{n} E\left(\left|Y_{t}^{n}-Y_{s}^{n}\right|^{2 p}\right) \leq C|t-s|^{p}
$$

Proof: Fix $p \in[1+\infty), s, t \in \mathbb{R}$. Then for every $n \geq 1$

$$
E\left(\left|Y_{t}^{n}-Y_{s}^{n}\right|^{2 p}\right) \leq C\left(T_{1}+T_{2}+T_{3}+T_{4}\right)
$$

with

$$
\begin{aligned}
& T_{1}=E\left(\left|\int_{s}^{t} F\left(Y_{u}^{n}\right) d W_{u}\right|^{2 p}\right) \\
& T_{2}=E\left(\left|\int_{s}^{t} G\left(Y_{u}^{n}\right) \dot{\omega}_{u}^{n} d u\right|^{2 p}\right), \\
& T_{3}=E\left(\left|\int_{s}^{t} H\left(Y_{u}^{n}\right) \dot{h}_{u} d u\right|^{2 p}\right), \\
& T_{4}=E\left(\left|\int_{s}^{t} B\left(Y_{u}^{n}\right) d u\right|^{2 p}\right)
\end{aligned}
$$

Burkholder's inequality together with Schwarz's and Hölder's inequalities imply that

$$
T_{1}+T_{3}+T_{4} \leq C|t-s|^{p}
$$

Finally, $T_{2} \leq T_{2,1}(n)+T_{2,2}(n)$, where

$$
\begin{aligned}
& T_{2,1}(n)=E\left(\left|\int_{s}^{t} G\left(Y_{\underline{u}_{n}}^{n}\right) \dot{\omega}_{u}^{n} d u\right|^{2 p}\right) \\
& T_{2,2}(n)=E\left(\left|\int_{s}^{t}\right| G\left(Y_{u}^{n}\right)-G\left(Y_{\underline{u}_{n}}^{n}\right)| | \dot{\omega}_{u}^{n}|d u|^{2 p}\right)
\end{aligned}
$$

Clearly,

$$
\sup _{n} T_{2,1}(n) \leq C|t-s|^{p}
$$

Let $a>1, b>1$, be conjugate exponents; Hölder's inequality yields

$$
\begin{aligned}
T_{2,2}(n) & \leq|t-s|^{2 p-1} \int_{s}^{t}\left\{E\left(\left|G\left(Y_{u}^{n}\right)-G\left(Y_{\underline{u}_{n}}^{n}\right)\right|^{2 p a}\right\}^{\frac{1}{a}}\left\{E\left(\left|\dot{\omega}_{u}^{n}\right|^{2 p b}\right)\right\}^{\frac{t}{b}} d u\right. \\
& \leq C|t-s|^{2 p-1} 2^{n p} \int_{s}^{t}\left\{E\left(\left|Y_{u}^{n}-Y_{\underline{u}_{n}}^{n}\right|^{2 p a}\right)\right\}^{\frac{1}{a}} d u
\end{aligned}
$$

Thus the proof of (2.15) is reduced to checking that this estimate holds in the particular case $s=\underline{u}_{n}$ and $t=u$. The arguments above imply that

$$
\sup _{s} E\left(\left|\int_{\underline{s}_{n}}^{s}\left\{F\left(Y_{u}^{n}\right) d W_{u}+H\left(Y_{u}^{n}\right) \dot{h}_{u} d u+B\left(Y_{u}^{n}\right) d u\right\}\right|^{2 p}\right) \leq C 2^{-n p}
$$

Therefore, we should check that for every $p \in[1, \infty)$,

$$
\begin{equation*}
\sup _{s} E\left(\left|\int_{\underline{s}_{n}}^{s} G\left(Y_{u}^{n}\right) \dot{\omega}_{u}^{n} d u\right|^{2 p}\right) \leq C 2^{-n p} \tag{3.1}
\end{equation*}
$$

Clearly,

$$
\begin{aligned}
& E\left(\left|\int_{\underline{s}_{n}}^{s} G\left(Y_{u}^{n}\right) \dot{\omega}_{u}^{n} d u\right|^{2 p}\right) \leq C E\left(\left(2^{n} \int_{\underline{s}_{n}}^{s_{n}}\left|G\left(Y_{u}^{n}\right)\right| d u\right)^{2 p}\left|W_{\underline{s}_{n}}-W_{\underline{s}_{n}-2^{-n} \mathrm{~V} 0}\right|^{2 p}\right) \\
& \quad+C E\left(\left(2^{n} \int_{{\underset{s}{n}}^{s}}^{s}\left|G\left(Y_{u}^{n}\right)\right| d u\right)^{2 p}\left|W_{{\underset{s}{n}}^{n}}-W_{\underline{s}_{n}}\right|^{2 p}\right) \\
& \quad \leq C\left[E\left(\left|W_{\underline{s}_{n}}-W_{\left(\underline{g}_{n}-2^{-n}\right) \mathrm{V} 0}\right|^{2 p}\right)+E\left(\left|W_{{\underset{s}{n}}}-W_{\underline{s}_{n}}\right|^{2 p}\right)\right] \\
& \quad \leq C 2^{-n p} .
\end{aligned}
$$

Hence (3.1) holds, and this implies $\sup _{n} T_{2,2}(n) \leq C|t-s|^{p}$. The proof of (2.15) is complete.

Before proving (2.16), we check the following technical results.

Lemma 3.2. Suppose that $\left(Y_{.}{ }^{n}\right)$ is a sequence of processes such that (2.15) holds. Let $f$ be a globally Lipschitz function; then

$$
\begin{equation*}
\lim _{n} E\left(\sup _{1 \leq k \leq 2^{n}}\left|\int_{0}^{k 2^{-n}} f\left(Y_{\underline{s}_{n}}^{n}\right)\left\{\dot{\omega}_{s}^{n} d s-d W_{s}\right\}\right|^{2}\right)=0 \tag{3.2}
\end{equation*}
$$

Proof: For fixed $n$,

$$
\begin{aligned}
& E\left(\sup _{1 \leq k \leq 2^{n}}\left|\int_{0}^{k 2^{-n}} f\left(Y_{\underline{s}_{n}}^{n}\right)\left\{\dot{\omega}_{s}^{n} d s-d W_{s}\right\}\right|^{2}\right) \\
& =E\left(\sup _{1 \leq k \leq 2^{n}} \mid \sum_{i=1}^{k-1} f\left(Y_{(i-1) 2^{-n}}^{n}\right)\left[W_{i 2^{-n}}-W_{(i-1) 2^{-n}}\right]\right. \\
& \left.\quad-\left.\sum_{i=1}^{k-1} f\left(Y_{(i-1) 2^{-n}}^{n}\right)\left[W_{(i+1) 2^{-n}}-W_{i 2^{-n}}\right]\right|^{2}\right)
\end{aligned}
$$

$$
\left.\begin{array}{l}
=E\left(\sup _{1 \leq k \leq 2^{n}} \mid \sum_{i=1}^{k-1}\left[W_{(i+1) 2^{-n}}-W_{i 2^{-n}}\right]\left[f\left(Y_{i 2^{-n}}^{n}\right)-f\left(Y_{(i-1) 2^{-n}}^{n}\right)\right]\right. \\
\left.\quad+f(x) W_{2-n}-\left.f\left(Y_{(k-1) 2^{-n}}^{n}\right)\left[W_{k 2^{-n}}-W_{(k-1) 2^{-n}}\right]\right|^{2}\right) \\
\leq
\end{array}\right)\left(T_{1}^{n}+T_{2}^{n}+T_{3}^{n}\right), ~ \$
$$

where

$$
\begin{aligned}
& T_{1}^{n}=E\left(\sup _{1 \leq k \leq 2^{n}}\left|\int_{0}^{k 2^{-n}}\left[f\left(Y_{s_{n}}^{n}\right)-f\left(Y_{s_{n}}^{n}\right)\right] d W_{s}\right|^{2}\right) \\
& T_{2}^{n}=f(x) E\left(W_{2^{-n}}^{2}\right) \\
& T_{3}^{n}=E\left(\sup _{1 \leq k \leq 2^{n}} f^{2}\left(Y_{(k-1) 2^{-n}}^{n}\right)\left[W_{k 2^{-n}}-W_{(k-1) 2^{-n}}\right]^{2}\right) .
\end{aligned}
$$

Proposition 3.1 implies that $T_{1}^{n} \leq C 2^{-n}$; clearly $T_{2}^{n} \leq C 2^{-n}$. For any $t \in[0,1]$, set

$$
M_{t}^{n}=\int_{0}^{t} f\left(Y_{\underline{s}_{n}}\right) d W_{s}
$$

Proposition 3.1 implies that $\left.\sup _{n} \sup _{t} E\left(\left|Y_{t}^{n}\right|\right)^{2 p}\right)<\infty$ for any $p \in[1, \infty)$. Hence by Burkholder's inequality, for any $p \in[1, \infty)$, there exists $C$ such that for every $0 \leq s<t \leq 1$,

$$
\sup _{n} E\left(\left|M_{t}^{n}-M_{s}^{n}\right|^{2 p}\right) \leq C|t-s|^{p}
$$

Hence by Proposition 2.1, letting $p=3, \beta=\frac{1}{4}<\frac{1}{3}$, we have for every $n$,

$$
\begin{aligned}
P\left(\sup _{0<i \leq 2^{n}}\left|M_{i 2^{-n}}^{n}-M_{(i-1) 2^{-n}}^{n}\right|>\lambda\right) & \leq P\left(\sup _{s \neq t} \frac{\left|M_{t}^{n}-M_{s}^{n}\right|}{|t-s|^{\beta}} \geq \lambda 2^{n \beta}\right) \\
& \leq C \lambda^{-6} 2^{-\frac{3 n}{2}} .
\end{aligned}
$$

Hence

$$
\begin{aligned}
E\left(\sup _{0<i \leq 2^{n}}\left|M_{i 2^{-n}}^{n}-M_{(i-1) 2^{-n}}^{n}\right|^{2}\right) & \leq n^{-2} \\
& +2 \int_{1 / n}^{\infty} \lambda P\left(\sup _{i}\left|M_{i 2^{-n}}^{n}-M_{(i-1) 2^{-n}}^{n}\right| \lambda\right) d \lambda \\
& \leq n^{-2}+C n^{4} 2^{-\frac{3 n}{2}}
\end{aligned}
$$

Therefore $\lim _{n} T_{3}^{n}=0$, which completes the proof of (3.2).

Lemma 3.3. Let $\left(J_{t}^{n} ; t \in[0,1]\right)$ be a sequence of measurable processes such that there exists $p \in] 1, \infty), C>0$ and a sequence $\alpha(n)$ such that

$$
\begin{equation*}
\lim _{n} \alpha(n)=0, \quad \text { and } \quad \sup _{t} E\left(\left|J_{t}^{n}\right|^{2 p}\right) \leq \alpha(n) 2^{-n p} \tag{3.3}
\end{equation*}
$$

Then

$$
\begin{equation*}
\lim _{n} E\left(\sup _{1 \leq k \leq 2^{n}}\left|\int_{0}^{k 2^{-n}}\right| J_{s}^{n} \dot{\omega}_{s}^{n}|d s|^{2}\right)=0 \tag{3.4}
\end{equation*}
$$

Proof: Let $p>1$ and $q>1$ be conjugate exponents. By Hölder's inequality

$$
\begin{aligned}
E\left(\sup _{1 \leq k \leq 2^{n}}\left|\int_{0}^{k 2^{-n}}\right| J_{s}^{n} \dot{\omega}_{s}^{n}|d s|^{2}\right) & \leq\left\{E \int_{0}^{1}\left|J_{s}^{n}\right|^{2 p} d s\right\}^{\frac{1}{p}}\left\{E \int_{0}^{1}\left|\dot{\omega}_{s}^{n}\right|^{2 q} d s\right\}^{\frac{1}{q}} \\
& \leq C\left(\alpha(n) 2^{-n p}\right)^{\frac{1}{p}} 2^{n}=C \alpha(n)^{\frac{1}{p}}
\end{aligned}
$$

this clearly yields (3.4).
The following proposition proves the validity of (2.16).
Proposition 3.4. Assume that $F, G, H$ and $B$ satisfy (C) and that the solution $\left(Y^{n}\right)$ of (2.12) satisfies (2.15). Let ( $\left.Z.\right)$ be the solution of (2.13). Then

$$
\lim _{n} E\left(\sup _{0 \leq i \leq 2^{n}}\left|Y_{i 2^{-n}}^{n}-Z_{i 2-n}\right|^{2}\right)=0
$$

Proof: Let $n \geq 1, t=k 2^{-n}$; then

$$
\begin{aligned}
Y_{t}^{n}-Z_{t} & =\int_{0}^{t}\left[(F+G)\left(Y_{\underline{g}_{n}}^{n}\right)-(F+G)\left(Z_{\underline{s}_{n}}\right)\right] d W_{s} \\
& +\int_{0}^{t}\left[H\left(Y_{\underline{s}_{n}}^{n}\right)-H\left(Z_{\underline{s}_{n}}\right)\right] \dot{h}_{s} d s+\int_{0}^{t}\left\{\left[B+(\nabla G) F+\frac{1}{2}(\nabla G) G\right]\left(Y_{\underline{s}_{n}}^{n}\right)\right. \\
& \left.-\left[B+(\nabla G) F+\frac{1}{2}(\nabla G) G\right]\left(Z_{\underline{s}_{n}}\right)\right\} d s+\sum_{\alpha=1}^{5} A_{\alpha}(t)
\end{aligned}
$$

where

$$
\begin{aligned}
A_{1}^{n}(t) & =\int_{0}^{t}\left[F\left(Y_{s}^{n}\right)-F\left(Y_{\underline{g}_{n}}^{n}\right)-(F+G)\left(Z_{s}\right)+(F+G)\left(Z_{\underline{s}_{n}}\right)\right] d W_{s} \\
A_{2}^{n}(t) & =\int_{0}^{t}\left[H\left(Y_{s}^{n}\right)-H\left(Y_{\underline{s}_{n}}^{n}\right)-H\left(Z_{s}\right)+H\left(Z_{\underline{g}_{n}}\right)\right] \dot{h}_{s} d s \\
A_{3}^{n}(t) & =\int_{0}^{t}\left[B\left(Y_{s}^{n}\right)-B\left(Y_{\underline{s}_{n}}^{n}\right)-\left[B+(\nabla G) F+\frac{1}{2}(\nabla G) G\right]\left(Z_{s}\right)\right. \\
& \left.+\left[B+(\nabla G) F+\frac{1}{2}(\nabla G) G\right]\left(Z_{\underline{s}_{n}}\right)\right] d s, \\
A_{4}^{n}(t) & =\int_{0}^{t} G\left(Y_{\underline{s}_{n}}^{n}\right)\left\{\dot{\omega}_{s}^{n} d s-d W_{s}\right\}, \\
A_{5}^{n}(t) & =\int_{0}^{t}\left[G\left(Y_{s}^{n}\right)-G\left(Y_{\underline{s}_{n}}^{n}\right)\right] \dot{\omega}_{s}^{n} d s-\int_{0}^{t}\left[(\nabla G) F+\frac{1}{2}(\nabla G) G\right]\left(Y_{\underline{s}_{n}}^{n}\right) d s
\end{aligned}
$$

Gronwall's lemma applied to the function $\varphi(t)=E\left(\sup _{i 2^{-n} \leq t}\left|Y_{i 2^{-n}}^{n}-Z_{i 2-n}\right|^{2}\right)$ implies that

$$
E\left(\sup _{0 \leq i \leq 2^{n}}\left|Y_{i 2^{-n}}^{n}-Z_{i 2^{-n}}\right|^{2}\right) \leq C \sum_{\alpha=1}^{5} E\left(\sup _{0 \leq i \leq 2^{n}}\left|A_{\alpha}^{n}\left(i 2^{-n}\right)\right|^{2}\right)
$$

Burkholder's inequality and Proposition 3.1 imply that $E\left(\sup _{t}\left|A_{1}^{n}(t)\right|^{2}\right) \leq C 2^{-n}$, since (2.13) is a particular case of (2.12).

Schwarz's inequality yields $E\left(\sup _{t}\left|A_{2}^{n}(t)\right|^{2}\right) \leq C\|h\|_{\mathcal{H}}^{2} 2^{-n}$. Since $B$, $(\nabla G) F$ and $(\nabla G) G$ are Lipschitz, Proposition 3.1 implies $E\left(\sup _{t}\left|A_{3}^{n}(t)\right|^{2}\right)<\infty$. Lemma 3.2 yields $\lim _{n} E\left(\sup _{0 \leq k \leq 2^{n}}\left|A_{4}^{n}\left(k 2^{-n}\right)\right|^{2}\right)=0$. Therefore the proof of (2.16) reduces to check that

$$
\begin{align*}
& \lim _{n} E\left(\sup _{0 \leq k \leq 2^{n}} \mid \int_{0}^{k 2^{-n}}\left[G\left(Y_{s}^{n}\right)-G\left(Y_{\underline{s}_{n}}^{n}\right)\right] \dot{\omega}_{s}^{n} d s\right. \\
& \left.-\left.\int_{0}^{k 2^{-n}}\left[(\nabla G) F+\frac{1}{2}(\nabla G) G\right]\left(Y_{\underline{g}_{n}}^{n}\right) d s\right|^{2}\right)=0 \tag{3.5}
\end{align*}
$$

Taylor's formula implies that

$$
\left|G\left(Y_{s}^{n}\right)-G\left(Y_{\underline{s}_{n}}^{n}\right)-(\nabla G)\left(Y_{\underline{s}_{n}}^{n}\right)\left[Y_{s}^{n}-Y_{\underline{s}_{n}}^{n}\right]\right| \leq C\left|Y_{s}^{n}-Y_{\underline{s}_{n}}^{n}\right|^{2} .
$$

Set

$$
\begin{aligned}
\phi_{n}(s) & =\int_{\underline{s}_{n}}^{s}\left\{\left[F\left(Y_{u}^{n}\right)-F\left(Y_{\underline{s}_{n}}^{n}\right)\right] d W_{u}+\left[G\left(Y_{u}^{n}\right)-G\left(Y_{\underline{s}_{n}}^{n}\right)\right] \dot{\omega}_{u}^{n} d u\right. \\
& \left.+H\left(Y_{u}^{n}\right) \dot{h}_{u} d u+B\left(Y_{u}^{n}\right) d u\right\}
\end{aligned}
$$

then

$$
E\left(\sup _{1 \leq k \leq 2^{n}} \mid A_{5}^{n}\left(\left.k 2^{-n}\right|^{2}\right) \leq C \sum_{\alpha=1}^{6} T_{\alpha}^{n},\right.
$$

where

$$
\begin{aligned}
& T_{1}^{n}=E\left(\sup _{1 \leq k \leq 2^{n}}\left|\int_{0}^{k 2^{-n}}\right| Y_{s}^{n}-\left.\left.Y_{\underline{g}_{n}}^{n}\right|^{2}\left|\dot{\omega}_{s}^{n}\right| d s\right|^{2}\right), \\
& T_{2}^{n}=E\left(\sup _{1 \leq k \leq 2^{n}}\left|\int_{0}^{k 2^{-n}}\right| \nabla G\left(Y_{s}^{n}\right) \phi_{n}(s)| | \dot{\omega}_{s}^{n}|d s|^{2}\right), \\
& T_{3}^{n}=E\left(\sup _{1 \leq k \leq 2^{n}} \mid \int_{0}^{k 2^{-n}}(\nabla G) F\left(Y_{\underline{s}_{n}}^{n}\right)\left(\int_{\underline{s}_{n}}^{z_{n}} d W_{u}\right) \dot{\omega}_{s}^{n} d s\right.
\end{aligned}
$$

$$
\begin{aligned}
& \left.-\left.\int_{0}^{k 2^{-n}}(\nabla G) F\left(Y_{\underline{s}_{n}}^{n}\right) d s\right|^{2}\right), \\
T_{4}^{n}= & E\left(\sup _{1 \leq k \leq 2^{n}}\left|\int_{0}^{k 2^{-n}}(\nabla G) F\left(Y_{\underline{s}_{n}}^{n}\right)\left(\int_{s_{n}}^{s} d W_{u}\right) \dot{\omega}_{s}^{n} d s\right|^{2}\right), \\
T_{5}^{n}= & E\left(\sup _{1 \leq k \leq 2^{n}}\left|\int_{0}^{k 2^{-n}}(\nabla G) G\left(Y_{\underline{s}_{n}}^{n}\right)\left(\int_{\underline{s}_{n}}^{s_{n}} \dot{\omega}_{u}^{n} d u\right) \dot{\omega}_{s}^{n} d s\right|^{2}\right), \\
T_{6}^{n}= & E\left(\sup _{1 \leq k \leq 2^{n}} \mid \int_{0}^{k 2^{-n}}(\nabla G) G\left(Y_{\underline{s}_{n}}^{n}\right)\left(\int_{s_{n}}^{s} \dot{\omega}_{u}^{n} d u\right) \dot{\omega}_{s}^{n} d s\right. \\
& \left.-\left.\frac{1}{2} \int_{0}^{k 2^{-n}}(\nabla G) G\left(Y_{\underline{s}_{n}}^{n}\right) d s\right|^{2}\right) .
\end{aligned}
$$

Proposition 3.1 and Lemma 3.3 imply $\lim _{n} T_{1}^{n}=0$. Set $J_{s}^{n}=\nabla G\left(Y_{s}^{n}\right) \phi_{n}(s)$; then Proposition 3.1 and Hölder's inequality implies that if $a>1, b>1$ are conjugate exponents for any $p \in[1, \infty)$ and $s \in[0,1]$,

$$
\begin{aligned}
E\left(\left|J_{s}^{n}\right|^{2 p}\right) & \leq\left\{E\left(\left|\nabla G\left(Y_{s}^{n}\right)\right|^{2 p a}\right)\right\}^{\frac{1}{a}}\left\{E\left(\left|\phi_{n}(s)\right|^{2 p b}\right)\right\}^{\frac{1}{b}} \\
& \leq C\left\{E\left(\left|\phi_{n}(s)\right|^{2 p b}\right)\right\}^{\frac{1}{b}}
\end{aligned}
$$

Therefore, in order to apply Lemma 3.3, it suffices to check that $\sup _{s} E\left(\left|\phi_{n}(s)\right|^{2 p}\right) \leq$ $\alpha(n) 2^{-n p}$, with $\lim _{n} \alpha(n)=0$. Burkholder's and Hölder's inequalities and Proposition 3.1 yield

$$
\begin{aligned}
E\left|\phi_{n}(s)\right|^{2 p} & \leq C E\left[\left|\int_{\underline{s}_{n}}^{s}\right| Y_{u}^{n}-\left.\left.Y_{\underline{s}_{n}}^{n}\right|^{2} d u\right|^{p}+\right. \\
& +2^{n}\left(\int_{\underline{s}_{n}}^{s_{n}}\left|Y_{u}^{n}-Y_{\underline{s}_{n}}^{n}\right|^{2 p} d u\right)\left|W_{\underline{s}_{n}}-W_{\left(\underline{s}_{n}-2^{-n}\right) v_{0}}\right|^{2 p} \\
& +2^{n}\left(\int_{\underline{s}_{n}}^{s}\left|Y_{u}^{n}-Y_{\underline{g}_{n}}^{n}\right|^{2 p} d u\right)\left|W_{s_{n}}-W_{\underline{s}_{n}}\right|^{2 p} \\
& \left.+\left(\sup \left\{\left(\int_{I}\left|\dot{h}_{u}\right|^{2} d u\right)\right\}\right)^{p} ; \lambda(I) \leq 2^{1-n}\right\} 2^{-(n-1)(p-1)} \\
& \left.\left.+2^{-n(2 p-1)}\right) \int_{\underline{s}_{n}}^{s}\left(1+\left|Y_{u}^{n}\right|^{2 p}\right) d u\right] \\
& \leq C 2^{-\dot{n} p} \alpha(n),
\end{aligned}
$$

where $\alpha(n)=2^{-n p}+\sup \left\{\left(\int_{I}\left|\dot{h}_{u}\right|^{2} d u\right)^{p} ; \lambda(I) \leq 2^{1-n}\right\}$, which tends to zero as $n$ tend to $\infty$. Thus Lemma 3.3 implies that $\lim _{n} T_{2}^{n}=0$.

Since $Y_{(i-1) 2^{-n}}^{n}$ and $\left[W_{(i+1) 2^{-n}}-W_{i 2^{-n}}\right]$ are independent,

$$
T_{3}^{n}=E\left(\sup _{1 \leq k \leq 2^{n}}\left|\sum_{i=0}^{(k-2) \vee 0}(\nabla G) F\left(Y_{(i-1) 2^{-n} \mathrm{v} 0}^{n}\right)\left[\left(W_{(i+1) 2^{-n}}-W_{i 2^{-n}}\right)^{2}-2^{-n}\right]\right|^{2}\right)
$$

$$
\begin{aligned}
& \leq \sum_{i=0}^{2^{n}-2} E\left((\nabla G) F\left(Y_{(i-1) 2^{-n} \mathrm{~V} 0}^{n}\right)^{2}\right) E\left[\left|\left(W_{(i+1) 2^{-n}}-W_{i 2^{-n}}\right)^{2}-2^{-n}\right|^{2}\right] \\
& \leq C 2^{n} 2^{-2 n}
\end{aligned}
$$

so that $\lim _{n} T_{3}^{n}=0$. A similar computation yields

$$
\begin{aligned}
T_{6}^{n}= & E\left(\sup _{2 \leq k \leq 2^{n}} \mid \sum_{i=0}^{k-2}(\nabla G) G\left(Y_{i 2^{-n}}^{n}\right)\right. \\
& \left.\left.\left\{\left(2^{2 n} \int_{(i+1) 2^{-n}}^{(i+2) 2^{-n}} \int_{(i+1) 2^{-n}}^{s} d u d s\right)\left[W_{(i+1) 2^{-n}}-W_{i 2^{-n}}\right]^{2}-\frac{1}{2} 2^{-n}\right\}\right|^{2}\right) \\
\leq & C 2^{n} 2^{-2 n} \underset{n \rightarrow \infty}{\longrightarrow} 0 .
\end{aligned}
$$

Finally, by Doob's inequality and Proposition 3.1,

$$
\begin{aligned}
T_{4}^{n} & \leq E\left(\left|\int_{0}^{1} 2^{n}\left(s_{n}+2^{-n}-s\right)(\nabla G) F\left(Y_{\tilde{\sim}_{n}}^{n}\right)\left[W_{{\underset{s}{n}}^{n}}-W_{\underline{s}_{n}}\right] d W_{s}\right|^{2}\right) \\
& \leq C \int_{0}^{1} E\left(\left|(\nabla G) F\left(Y_{\tilde{s}_{n}}^{n}\right)\right|^{2}\right) E\left(\left|W_{s_{n}}-W_{\underline{s}_{n}}\right|^{2}\right) d s \\
& \leq C 2^{-n}
\end{aligned}
$$

and for conjugate exponents $a>1$ and $b>1$,

$$
\begin{aligned}
T_{5}^{n} & \leq E\left(\left|\int_{0}^{1}(\nabla G) G\left(Y_{\underline{g}_{n}}^{n}\right)\left(\int_{\underline{s}_{n}}^{s_{n}} \dot{\omega}_{u}^{n} d u\right) d W_{s}\right|^{2}\right) \\
& \leq C \int_{0}^{1} E\left((\nabla G) G\left(Y_{\underline{g}_{n}}^{n}\right)^{2 a}\right)^{\frac{1}{a}} E\left(\left|W_{\underline{s}_{n}}-W_{\left(\underline{g}_{n}-2^{-n}\right) \vee}\right|^{2 b}\right)^{\frac{1}{t}} d s \\
& \leq C 2^{-n}
\end{aligned}
$$

This completes the proof of $\lim _{n} E\left(\sup _{1 \leq k \leq 2^{n}}\left|A_{5}^{n}\left(k 2^{-n}\right)\right|^{2}\right)=0$, and hence that of the proposition.

Proposition 3.1 and 3.4 prove that (2.14) holds. Therefore Proposition 2.2 gives the following characterization of the support of the law of the diffusion $X$.

Theorem 3.5. Let $\sigma$ and $b$ be functions such that condition (H) is satisfied, and let $X$ be the diffusion solution of (1.1). Then, for any $\alpha \in\left[0, \frac{1}{2}[\right.$ the support of the probability $P \circ X^{-1}$ in $\mathcal{C}^{\alpha}\left([0,1], \mathbb{R}^{m}\right)$ is the closure $\mathcal{S}$ of the set $\{S(h), h \in \mathcal{H}\}$, where $S(h)$ is given by (1.3).
