Abstract

We prove the existence and uniqueness for a semilinear elliptic problem with memory, both in the weak and the classical setting. This problem describes the effective behaviour of a biological tissue under the injection of an electrical current in the radiofrequency range. *To cite this article: M. Amar et al., C. R. Acad. Sci. Paris, Ser. I 338 (2004).*

1. Introduction

Let Ω be an open bounded subset of \mathbb{R}^N with regular boundary and let $T > 0$. We study the existence, uniqueness and regularity for the solution of the semilinear problem

$$\begin{cases} -\operatorname{div}\left(A(x)\nabla_x u + \int_0^t B(x, t-\tau)\nabla_x u(x, \tau) d\tau\right) = g(x, t, u) & \text{in } \Omega \times (0, T), \\ u = f & \text{in } \partial\Omega \times (0, T), \end{cases} \quad (1)$$

where $A(x)$ is a symmetric and positive definite matrix, $B(x, t)$ is a symmetric matrix, $g : \Omega \times (0, T) \times \mathbb{R} \rightarrow \mathbb{R}$ and $f : \overline{\Omega} \times (0, T) \rightarrow \mathbb{R}$ are given functions. More precisely, in Section 2 we prove the well-posedness of problem (1) in a weak sense, by using a fixed point technique:

E-mail addresses: amar@dmmm.uniroma1.it (M. Amar), andreucci@dmmm.uniroma1.it (D. Andreucci), bisegna@uniroma2.it (P. Bisegna), gianni@dmmm.uniroma1.it (R. Gianni).

Theorem 1.1. *Let $A \in L^\infty(\Omega; \mathbb{R}^{N^2})$ be such that $\lambda|\xi|^2 \leq A(x)\xi \cdot \xi \leq \Lambda|\xi|^2$, for suitable $0 < \lambda < \Lambda < +\infty$, for almost every $x \in \Omega$ and every $\xi \in \mathbb{R}^N$; let $B \in L^2(0, T; L^\infty(\Omega; \mathbb{R}^{N^2}))$, and let $f \in L^2(0, T; H^1(\Omega))$. Assume that $g : \Omega \times (0, T) \times \mathbb{R} \rightarrow \mathbb{R}$ is a Carathéodory function such that*

- (G1) $g(\cdot, \cdot, 0) \in L^2(0, T; H^{-1}(\Omega))$,
- (G2) $|g(x, t, s) - g(x, t, s')| \leq L|s - s'|$ for a.e. $(x, t) \in \Omega \times (0, T)$, and every $s, s' \in \mathbb{R}$,

where $L \leq \frac{\lambda}{3C}$, if C is the best constant in the classical Poincaré inequality on Ω .

Then, there exists a unique function $u \in L^2(0, T; H^1(\Omega))$ satisfying in the sense of distributions problem (1).

In Section 3 we prove that, under further regularity assumptions on the data, existence and uniqueness of classical solutions of (1) hold true, by using a delay technique. This regularity is instrumental in applications (see [2]).

Theorem 1.2. *Let $m \geq 0$ be any fixed integer and let also $0 < \alpha < 1$. Let $A \in C^{1+\alpha}(\overline{\Omega}; \mathbb{R}^{N^2})$ satisfy the assumption of Theorem 1.1 and $B \in C^0([0, T]; C^{1+\alpha}(\overline{\Omega}; \mathbb{R}^{N^2}))$ be such that $B' \in L^2(0, T; W^{1,\infty}(\Omega; \mathbb{R}^{N^2}))$. Assume that $g \in C^0([0, T]; C^{m+\alpha}(\overline{\Omega} \times \mathbb{R}))$ satisfies (G2) of Theorem 1.1, with $\gamma L < 1$, where γ is a structural constant depending only on $\lambda, \Lambda, N, \Omega, \beta, A, B$, and that there exists $L_0 > 0$ such that*

- (G3) $|g(x, t, s)|, |\nabla_x g(x, t, s)|, |g_t(x, t, s)| \leq L|s| + L_0$.

Let $f \in C^0([0, T]; C^{m+2+\alpha}(\overline{\Omega}))$, with $f_t \in L^\infty(0, T; C^{m+2+\alpha}(\overline{\Omega}))$. Then there exists a unique function $u \in C^0([0, T]; C^{1+\alpha}(\overline{\Omega})) \cap L^\infty(0, T; C^{m+2+\alpha}(\overline{\Omega}))$ solving (1) in the classical sense.

In the linear case, our problem can be compared to those studied in the context of linear elasticity in [4,5], where (1) is reduced to a Volterra equation and solved, under suitable hypotheses, by means of the spectral theory in $C^0([0, T]; C^{2+\alpha}(\overline{\Omega}))$. Problem (1), again in the linear case, is also studied in [3], in the context of weak solvability. There, the Fourier transform technique is applied, under some assumptions on the asymptotic behaviour of the kernel B , in order to obtain the existence in the space $L^2(-\infty, +\infty; H^2(\Omega))$.

From the physical point of view, problem (1) describes the effective behaviour of a biological tissue under the injection of an electrical current in the radiofrequency range [1,2]. Here, the unknown u represents the electrical potential and the driven electrical current $-A(x)\nabla_x u - \int_0^t B(x, t - \tau)\nabla_x u(x, \tau) d\tau$ depends on the history of the electrical field $-\nabla_x u$, therefore it is nonlocal in time.

2. Proof of Theorem 1.1

We note that, possibly replacing u with $v = u - f$ and g with $\tilde{g}(x, t, u) = g(x, t, u) - \text{div}(A(x)\nabla_x f + \int_0^t B(x, t - \tau)\nabla_x f(x, \tau) d\tau)$, there is no loss of generality in assuming $f \equiv 0$. Consider the Banach space $X = L^2(0, T_1; H^1_0(\Omega))$, endowed with the usual norm $\|u\|_X := (\int_0^{T_1} \int_\Omega |\nabla_x u|^2 dx dt)^{1/2}$, where T_1 will be chosen later. Let us introduce an operator H acting on X by means of $H(u) = w$, where w is the solution of $-\text{div}(A(x)\nabla_x w) = \text{div}(\int_0^t B(x, t - \tau)\nabla_x u(x, \tau) d\tau) + g(x, t, u)$, with null trace on $\partial\Omega$, and t fixed almost everywhere in $(0, T)$. Clearly, the operator H is well defined; moreover, multiplying the previous equation by w and integrating by parts, we obtain that $H(X) \subset X$.

Given $u_1, u_2 \in X$, we have that $w = H(u_1) - H(u_2)$ has null trace on the boundary $\partial\Omega$ and solves $-\text{div}(A(x)\nabla_x w) = \text{div}(\int_0^t B(x, t - \tau)\nabla_x u(x, \tau) d\tau) + g(x, t, u_1) - g(x, t, u_2)$, where $u = u_1 - u_2$. Again multiplying the previous equation by w and integrating by parts, it follows

$$\|w\|_X^2 = \|H(u_1) - H(u_2)\|_X^2 \leq \frac{\gamma}{\delta} T_1 \|u\|_X^2 + \gamma \delta \|w\|_X^2 + \frac{CL}{2\lambda} \|u\|_X^2 + \frac{CL}{2\lambda} \|w\|_X^2,$$

where γ depends only on λ and B . Now, recalling that $L \leq \frac{\lambda}{3C}$ and choosing $\delta = \frac{1}{6\gamma}$ and $T_1 < \frac{1}{36\gamma^2}$, we can absorb the second and the fourth term of the last inequality into the left-hand side, obtaining that H is a contraction. So, it admits a unique fixed point, i.e., a solution of (1) exists in X . Noting that the width T_1 of the time interval is independent of the iteration step, we may conclude the proof by iterating this argument over $(0, T)$.

Remark 1. It is well known, in the case of linear elliptic equations (i.e., (1) with $B \equiv 0, g = \sigma u + h$), that a unique solution exists if $\sigma \in \mathbb{R}$ is not an eigenvalue of the differential operator.

In our case, a similar result holds. Let us look at the problem (1) where $g(x, t, u) = \sigma(t)u + h(x, t)$, with $h \in L^2(0, T; H^{-1}(\Omega))$ and $\sigma \in L^\infty(0, T)$, with $\text{dist}(\sigma(t), \sigma_A) \geq c_0 > 0$, where σ_A denotes the spectrum of the elliptic operator associated to the matrix A , with homogeneous Dirichlet boundary conditions.

Note that we dispense here with the requirement (G2) on the smallness of the Lipschitz constant L . In fact, the proof of Theorem 1.1 can be carried out in this case essentially as above, once we have established that the solution $w \in H_o^1(\Omega)$ of $-\text{div}(A(x)\nabla_x w) - \sigma(t)w = \text{div}(\int_0^t B(x, t - \tau)\nabla_x u(x, \tau) d\tau)$ satisfies, for every $u \in L^2(0, T; H_o^1(\Omega))$, $\|w(t)\|_{H_o^1(\Omega)} \leq K \|u\|_{L^2(0, T; H_o^1(\Omega))}$, $\forall 0 \leq t \leq T$, with K independent of t . In turn this estimate follows from Fredholm theory and from our assumptions on the function σ .

3. Proof of Theorem 1.2

We will prove that the unique weak solution found in Theorem 1.1 actually belongs to $C^0([0, T]; C^{1+\alpha}(\overline{\Omega})) \cap L^\infty(0, T; C^{m+2+\alpha}(\overline{\Omega}))$.

Assume $m = 0$ and set

$$\|u\|_{(2+\alpha)}^t := \text{ess sup}_{0 \leq \tau \leq t} \|u(\cdot, \tau)\|_{(2+\alpha)}, \tag{2}$$

where $\|\cdot\|_{(m+\alpha)}$ is the norm in $C^{m+\alpha}(\overline{\Omega})$. Analogously, if we indicate with $\|\cdot\|_{2,q}$ and $\|\cdot\|_\infty$ the norms in $W^{2,q}(\Omega)$ and $L^\infty(\Omega)$, respectively, we can consider the corresponding norms $\|\cdot\|_{2,q}^t$ and $\|\cdot\|_\infty^t$ in the sense of (2).

Let us introduce a sequence of approximating problems

$$-\text{div}(A(x)\nabla_x u_h) = \text{div}\left(\int_0^{t_h} B(x, t - \tau)\nabla_x u_h(x, \tau) d\tau\right) + g(x, t, u_h(x, t_h)) \quad \text{in } \Omega \times (0, T), \tag{3}$$

$$u_h(x, t) = f(x, t) \quad \text{on } \partial\Omega \times (0, T),$$

where $t_h = \max(0, t - h)$, for $0 < t < T$ and any fixed $h > 0$, and $u_h(x, 0) =: u_0(x)$ is given by the unique solution of the standard elliptic nonlinear equation

$$-\text{div}(A(x)\nabla_x u_0(x)) = g(x, 0, u_0(x))$$

which coincides with $f(\cdot, 0)$ on the boundary $\partial\Omega$.

Existence of a solution $u_h \in C^0([0, T] \times \overline{\Omega} \times \mathbb{R}) \cap L^\infty(0, T; C^{2+\alpha}(\overline{\Omega}))$ is elementary, moreover, by standard elliptic estimates, using also (G3), we have that, for every $t \in [0, T]$,

$$\begin{aligned} \|u_h\|_{2+\alpha}^t &\leq \gamma \left(\int_0^{t_h} \|u_h\|_{2+\alpha}^\tau d\tau + L \|u_h\|_{2+\alpha}^t + \|\nabla_x g(u_h)\|_\infty^t + \|g(u_h)\|_\infty^t + \|f\|_{2+\alpha}^t \right) \\ &\leq \gamma \left(\int_0^t \|u_h\|_{2+\alpha}^\tau d\tau + 3L \|u_h\|_{2+\alpha}^t + 2L_0 + \|f\|_{2+\alpha}^T \right), \end{aligned} \tag{4}$$

where γ is a structural constant depending on $\lambda, A, N, \Omega, \beta, A, B$. Taking into account that L is small and using Gronwall’s lemma, it follows that $\|u_h\|_{2+\alpha}^T \leq \gamma$, where γ now depends also on $L, L_0, \|f\|_{2+\alpha}^T$. Now let us consider the following problem

$$\begin{aligned}
 -\operatorname{div}(A(x)\nabla_x u'_h) &= \operatorname{div}\left(B(x, h)\frac{\partial t_h}{\partial t}\nabla_x u_h(x, t) + \int_0^{t_h} B'(x, t - \tau)\nabla_x u_h(x, \tau) \, d\tau\right) \\
 &\quad + g_s(x, t, u_h(x, t_h))u'_h(x, t_h)\frac{\partial t_h}{\partial t} + g_t(x, t, u_h(x, t_h)),
 \end{aligned}
 \tag{5}$$

with $u'_h = f_t$ on the boundary $\partial\Omega$ and u' stands for the temporal derivative of u .

This is a standard linear elliptic problem in u'_h (where u_h and $u'_h(x, t_h)$ are regarded as known functions), with a nonzero source term. Hence (see, e.g., [6], Chapter 9) for every $q \geq 2$, we have existence and uniqueness of a solution $u'_h \in L^\infty(0, T; W^{2,q}(\Omega))$; moreover, $\|u'_h\|_{2,q}^t \leq \gamma(\|u_h\|_{2,q}^t + L\|u'_h\|_{L^q}^{t_h} + \|g_t(u_h)\|_\infty^t + \|f_t\|_{2,q}^t)$. Therefore, since L is sufficiently small, using again (G3), we obtain

$$\|u'_h\|_{2,q}^T \leq \gamma(\|u_h\|_{2,q}^T + L_0 + \|f_t\|_{2,q}^T) \leq \gamma.
 \tag{6}$$

By (6) and taking into account that (4) implies $\|u_h\|_{2+\alpha}^T \leq \gamma$, it follows that $u_h, (u_h)_{x_i}, (u_h)_{x_i x_j} \in L^\infty(\Omega_T), (u_h)_t, (u_h)_{tx_i}, (u_h)_{tx_i x_j} \in L^q(\Omega_T)$ uniformly with respect to h , where $\Omega_T = \Omega \times (0, T)$. This implies that, if we choose $q > N$ sufficiently large, the sequences $\{u_h\}, \{(u_h)_{x_i}\}$ are compactly embedded in $C^0(\overline{\Omega_T})$, being uniformly Hölder continuous with exponent α . Now, up to a subsequence, we can pass to the limit for $h \rightarrow 0^+$ in the weak formulation of (3), obtaining that $u_h \rightarrow u \in C^0([0, T]; C^{1+\alpha}(\overline{\Omega}))$, where u is a solution of (1). Moreover, $u \in L^\infty(0, T; C^{2+\alpha}(\overline{\Omega}))$, as follows by applying the calculations in (4) to the original problem solved by u .

Now let $m \in \mathbb{N}$. By classical elliptic estimates, it follows

$$\|u(\cdot, t)\|_{(m+2+\alpha)} \leq \gamma_1 \|g(u)\|_{(m+\alpha)}^t + \gamma_1 \|f\|_{(m+2+\alpha)}^t + \gamma_2 \int_0^t \|u(\cdot, \tau)\|_{(m+2+\alpha)} \, d\tau$$

where $g(u) = g(x, t, u(x, t))$. After an application of Gronwall’s lemma, we obtain

$$\|u\|_{(m+2+\alpha)}^T \leq \gamma_1 \|g(u)\|_{(m+\alpha)}^T + \gamma_1 \|f\|_{(m+2+\alpha)}^T.
 \tag{7}$$

Hence, $u \in L^\infty(0, T; C^{m+2+\alpha}(\overline{\Omega}))$, whenever $\|g(u)\|_{(m+\alpha)}^T$ is bounded. If $m = 1$, by the first part of the proof we have that $\|g(u)\|_{(1+\alpha)}^T$ is bounded, which implies that u actually belongs to $L^\infty(0, T; C^{3+\alpha}(\overline{\Omega}))$. The proof is then concluded by induction over m in (7).
