Abstract

We present a new formula to compute Dixmier traces \( \tau_\omega(T) \) of pseudodifferential operators (respectively, almost periodic pseudodifferential operators) of order \(-n\) on \(n\)-dimensional compact Riemannian manifolds (respectively, \(\mathbb{R}^n\)). Under a natural condition on the operator \(T\), we show that \( \tau_\omega(T) = \lim_{t \to \infty} \frac{1}{\log(1+t)} \int_{G} \lambda \in \frac{1}{t} G \, d\mu_T(\lambda) \), where \(G\) is any bounded neighborhood of \(0 \in \mathbb{C}\) and \(\mu_T\) is the Brown spectral measure of \(T\). If \(T\) is measurable, then the \(\omega\)-limit may be replaced with the true (ordinary) limit. Our approach works equally well in both type I and II settings.

les borniéliens $B \subseteq \mathbb{C}$). Nous donnons ici une formule analogue pour les traces de Dixmier. Nous définissons $\mathcal{L}^{1,\infty} = \{ T \in \mathcal{N} : \sup_{t>0} \frac{1}{-\log(1+t)} \int_0^t s \mu_s(T) \, ds < \infty \}$, où $\mu_s(T)$ est la $t$-ième valeur singulière de $T$ [10]. Lorsque $\omega$ est un état sur $L^\infty(0, \infty)$, s’annulant sur les fonctions à support compact et satisfaisant $\omega(M f) = \omega(f)$ pour toute $f \in L^\infty(0, \infty)$, avec $M f(t) = \frac{1}{t} \int_0^t s \mu_s(T) \, ds, \quad t \geq 0$, la trace de Dixmier [5,8] est

$$\tau_\omega(T) = \omega(\lim_{t \to \infty} \frac{1}{-\log(1+t)} \int_0^t s \mu_s(T) \, ds) \quad \text{pour } T \in \mathcal{L}^{1,\infty}, \text{ positif et s'étend par linéarité dans le cas général.}$$

Dans le cas classique, si $T$ est un opérateur à trace, compact, auto-adjoint, le théorème de Lidskii se déduit directement du théorème spectral pour les opérateurs positifs et de la convergence absolue de la série des valeurs propres de $T$. Si $T = T^*$ est dans $\mathcal{L}^{1,\infty}$, cette série peut diverger, ce qui est un obstacle non trivial. En effet, nous montrerons comme parti des résultats principaux que si $T = T^* \in \mathcal{L}^{1,\infty}$ vérifie $|\lambda_n(T)| \leq \frac{C}{n}$ pour un $C > 0$ et tout $n \geq 1$, avec $|\lambda_1(T)| \geq |\lambda_2(T)| \geq \cdots$ si $\tau_\omega$ est une trace de Dixmier, alors $\tau_\omega(T) = \omega(\lim_{N \to \infty} \frac{1}{-\log(1+N)} \sum_{n=1}^N \lambda_n(T))$. De plus, si $T$ est mesurable au sens de Connes [5], on peut remplacer dans cette formule la limite finie par la limite au sens usuel.

1. Introduction

The well-known Lidskii theorem (in its general semifinite form given in [1]) asserts that if $\mathcal{N}$ is a semifinite von Neumann factor with a faithful normal semifinite trace $\tau$, then the trace $\tau(T)$ of an arbitrary operator $T \in \mathcal{L}(\mathcal{N}, \tau)$ is given by $\tau(T) = \int_{\mathcal{N}(T)} \lambda \, d\mu_T(\lambda)$, where $\mu_T$ is the Brown’s measure of $T$. In the case when $\mathcal{N}$ is a type I factor, the measure $\mu_T$ is the counting measure on the set of all eigenvalues of $T$. In this paper, we present an analogue of such a formula for Dixmier traces. Let $\omega$ be a state on $L^\infty(0, \infty)$ which vanishes on functions with compact support and such that $\omega(M f) = \omega(f)$ for every $f \in L^\infty(0, \infty)$, where $M f(t) = \frac{1}{t} \int_0^t s \mu_s(T) \, ds$. It will be convenient to write $\omega(\lim_{t \to \infty} f(t))$ instead of $\omega(f)$, $f \in L^\infty(0, \infty)$. The Dixmier trace [5,6] $\tau_\omega(T)$ defined on the ideal $\mathcal{L}^{1,\infty} := \{ T \in \mathcal{N} : \sup_{t>0} \frac{1}{-\log(1+t)} \int_0^t s \mu_s(T) \, ds < \infty \}$ is given by $\tau_\omega(T) = \omega(\lim_{t \to \infty} \frac{1}{-\log(1+t)} \int_0^t s \mu_s(T) \, ds)$ if $T \in \mathcal{L}^{1,\infty}$ is positive and by linearity otherwise. Here, $\mu_T(\lambda) = \inf \|TE\|$: $E$ is a projection in $\mathcal{N}$ with $\tau(1-E) \leq t$ is the $t$th generalized s-number of the operator $T$.

In the case of a standard (normal) trace, the assertion of the Lidskii theorem for self-adjoint operators is immediate due to the absolute convergence of the series $\sum_{n=1}^\infty \lambda_n(T)$ of any $T = T^*$ from the trace class. This is not the case anymore for Dixmier (non-normal) traces, since the latter series diverges for all $T = T^* \in \mathcal{L}^{1,\infty}$ which does not belong to the trace class.

The distribution function of $T \in \mathcal{N}$ is defined by $\lambda_s(T) := \tau(|T|^{1/2}(|T|^{1/2}))$, $t > 0$. We have $\mu_s(T) = \inf \{ t \geq 0 : \lambda_s(T) \leq s \}$ and for any $s, t > 0$, $s \geq \lambda_s(T)$ if and only if $\mu_s(T) \leq t$. Furthermore, $\int_0^t \lambda_s(T) \, ds = \tau(|T|^{1/2}(|T|^{1/2}))$, $\forall t > 0$. These facts may be found in [2,10]. We write $s \prec t$ if $\int_0^s \mu_s(D) \, ds \leq \int_0^t \mu_s(T) \, ds$, $\forall t > 0$.

Our main result is given in Theorem 2.11 below. The Lidskii type formula given there holds for all operators $T \in \mathcal{L}^{1,\infty}$ satisfying $\mu_s(T) \leq C/t$ for some $C > 0$ and all $t > 0$. The set of such operators form an ideal in $\mathcal{N}$ denoted by $\mathcal{L}^{1,w}$. The ideal $\mathcal{L}^{1,w}$ usually arises in geometric applications. In particular, if $\mathcal{N}$ is the algebra of all bounded operators on $L^2(M)$ where $M$ is a compact Riemannian $n$-manifold (respectively, if $\mathcal{N}$ is the $II_1$-factor $L^\infty(\mathbb{R}^2) \rtimes \mathbb{R}$, the ideal $\mathcal{L}^{1,w}$ contains all pseudodifferential operators (respectively, all almost periodic pseudodifferential operators) of order $-n$.

An operator $T$ from $\mathcal{L}^{1,\infty}$ is said to be measurable if $\tau_\omega(T)$ does not depend on the state $\omega$ [5]. For an arbitrary subset $A \subseteq \mathcal{N}$, we denote by $A_\omega$ the set of measurable elements from $A$.

Our formula takes an especially simple form for the case of measurable operators $T$. In this case, $\tau_\omega(T)$ coincides with the true limit $\lim_{t \to \infty} \frac{1}{-\log(1+t)} \int_0^t s \mu_s(T) \, ds$ for an arbitrary $\omega$.

Our results depend crucially on the recent characterization of positive measurable operators from $\mathcal{L}^{1,\infty}$ as those for which the limit $\lim_{t \to \infty} \frac{1}{-\log(1+t)} \int_0^t s \mu_s(T) \, ds$ exists [11, Theorem 6.6], and the spectral characterization of sums of commutators in type II factors [8,9].
2. Lidskii formulae for Dixmier traces

Lemma 2.1. If \( T \geq 0 \) in \( L^{1,1}_m \) then there exists \( S \in L^{1,1}_m \) such that \( T \leq S \), \( \text{supp}(S) \leq \text{supp}(T) \) and \( ST = TS \).

Proof. If \( \mathcal{N} \) is a type II factor, then the assertion follows from [7, Proposition 3.2]. The type I case is straightforward. \( \square \)

The proof of the following lemma is straightforward and is therefore omitted.

Lemma 2.2. If \( T \in L^{1,\infty}_m \) then \( T^*, \text{Re}(T), \text{Im}(T) \in L^{1,\infty}_m \). The same assertion also holds for \( L^{1,1}_m \).

Remark 1. The positive and negative parts of a measurable self-adjoint operator \( T \in L^{1,\infty}_m \) are not necessarily measurable.

Lemma 2.3 (see [2]). For \( T \in L^{1,\infty}_m \), we have \( \lambda_{1/t}(T) \leq Ct \log t \), for some \( C > 0 \), and all sufficiently large \( t \).

For brevity, we write \( f_t(T) = \int_0^t \mu_s(T) \, ds \) and \( g_t(T) = \int_0^{\lambda_{1/t}(T)} \mu_s(T) \, ds \), \( t > 0 \). The results given in Proposition 2.4 and Lemma 2.5 below are similar to those obtained in [2, Proposition 2.4] under different assumptions on \( \omega \) and \( T \).

Proposition 2.4. If \( T \geq 0 \) in \( L^{1,1}_m \), then for every \( C > 0 \)

\[ \tau_\omega(T) = \omega \lim_{t \to \infty} \frac{1}{\log(1+t)} f_t(T) = \omega \lim_{t \to \infty} \frac{1}{\log(1+t)} \int_0^{Ct \log t} \mu_s(T) \, ds, \]

and if one of the \( \omega \)-limits is a true limit then so is the other.

Proof. For \( T \geq 0 \) in \( L^{1,1}_m \), we have \( \frac{1}{\log(1+t)} \int_0^{Ct \log t} \mu_s(T) \, ds - f_t(T) \leq \frac{M}{\log(1+t)} (\log(Ct \log t) - \log t) \to 0 \) as \( t \to \infty \) for some \( M > 0 \). The second assertion is proved in [2, Proposition 2.4]. \( \square \)

Lemma 2.5. If \( T \geq 0 \) in \( L^{1,1}_m \) then

\[ \tau_\omega(T) = \omega \lim_{t \to \infty} \frac{1}{\log(1+t)} g_t(T). \] \tag{1}

If \( T \) is measurable then the \( \omega \)-limit can be replaced with the true limit.

Proof. It follows from Lemma 2.3 and Proposition 2.4 that

\[ \omega \lim_{t \to \infty} \frac{1}{\log(1+t)} g_t(T) \leq \omega \lim_{t \to \infty} \frac{1}{\log(1+t)} \int_0^{Ct \log t} \mu_s(T) \, ds = \tau_\omega(T). \] \tag{2}

Further, since \( s > \lambda_{1/t} \) implies \( \mu_s(T) \leq 1/t \), we have \( f_t(T) \leq g_t(T) + \frac{1}{t} (t - \lambda_{1/t}(T)) \leq g_t(T) + 1 \). Hence,

\[ \tau_\omega(T) \leq \omega \lim_{t \to \infty} \frac{1}{\log(1+t)} g_t(T). \] \tag{3}

Combining (2) and (3), we arrive at (1). The second assertion follows from Proposition 2.4 and [11, Theorem 6.6]. \( \square \)

Lemma 2.6. If \( A, B, C \geq 0 \) in \( L^{1,1}_m \) and \( C = A + B \) then
and self-adjoint. Let $S$ be the first assertion follows from Lemma 2.5 and the linearity of Dixmier traces. Let $i$ satisfy $\mu_1(A') = \mu_1(A), \mu_1(B') = \mu_1(B)$ for all $A' \geq 0$ and $A' B' = 0$. According to [3, Lemma 2.3] we have $C' \prec \prec C$. Combining this fact with the observation that $\mu(C) \prec \prec \mu(A) + \mu(B)$ [10, Proposition 2.4], we see that it is sufficient to prove that

$$
\lim_{t \to \infty} \frac{1}{\log(1 + t)} |f_t(A') + f_t(B') - f_t(C')| = 0.
$$

Since $A'$ and $B'$ are orthogonal, we have

$$
g_t(A') + g_t(B') - g_t(C') = 0.
$$

Combining (6) with Lemma 2.3 and the argument in the proof of Proposition 2.4 we arrive at (4(i)). The proof of (4(ii)) is similar.

**Lemma 2.7.** Let $T \in \mathcal{L}^{1,w}$ be normal and $T = T_1 - T_2 + iT_3 - iT_4$, where $T_1, \ldots, T_4 \geq 0$. Then $\tau_\omega(T) = \omega \lim_{t \to \infty} \frac{1}{\log(1 + t)} g_t(T_1) - g_t(T_2) + i g_t(T_3) - i g_t(T_4)$. If $T$ is measurable then the $\omega$-limit can be replaced with the true limit.

**Proof.** The first assertion follows from Lemma 2.5 and the linearity of Dixmier traces. Let $T$ be measurable and self-adjoint. Let $S \geq 0$ in $\mathcal{L}^{1,\infty}$ be a measurable operator commuting with $T_-$ such that $S - T_- \geq 0$ and $\text{supp}(S) \subseteq \text{supp}(T_-)$ (see Lemma 2.1). We have $\tau_\omega(T) = \tau_\omega(S + T) - \tau_\omega(S) = \omega \lim_{t \to \infty} \frac{1}{\log(1 + t)} f_t(S + T) - \omega \lim_{t \to \infty} \frac{1}{\log(1 + t)} f_t(S)$. Since $0 \leq T, T + S$ are measurable, we may combine [11, Theorem 6.6] with Lemma 2.5 to obtain $\tau_\omega(T) = \lim_{t \to \infty} \frac{1}{\log(1 + t)} g_t(S + T) - \lim_{t \to \infty} \frac{1}{\log(1 + t)} g_t(S)$. Since $S + T = S - T_+ + T_+$ and the operators $S - T_-$ and $T_+$ are disjoint, we have $g_t(S + T) = g_t(S - T_-) + g_t(T_+)$. Eq. (4(ii)) of Lemma 2.6 with $A = T_-, B = S - T_-$ and $C = S$ now yields $\lim_{t \to \infty} \frac{1}{\log(1 + t)} (g_t(T_+) - g_t(T_-) - g_t(S - T_+)) = 0$. Taking the $\omega$-limit, we conclude from [11, Theorem 6.6] that

$$
\tau_\omega(T) = \omega \lim_{t \to \infty} \frac{g_t(T_+) - g_t(T_-)}{\log(1 + t)} = \lim_{t \to \infty} \frac{g_t(S + T) - g_t(S)}{\log(1 + t)}.
$$

If $T$ is normal, the assertion now follows from Lemma 2.2.

**Lemma 2.8.** If $T \in \mathcal{L}^{1,w}$ is normal and $a > 0$ then $\tau_\omega(T) = \omega \lim_{t \to \infty} \frac{1}{\log(1 + t)} \int_{|x| \leq a} \lambda d\mu_T(\lambda)$, where $Q_1 = \{x + iy : x \leq a, |y| \leq a\} \forall t > 0$. If $T$ is measurable, then the $\omega$-limit can be replaced with the true limit.

**Proof.** We may take $a = 1$, by dilation invariance of $\omega$ [5, p. 305]. Let $T = T_1 - T_2 + iT_3 - iT_4$, where $T_1, \ldots, T_4 \geq 0$. For $T \geq 0$ in $\mathcal{L}^{1,w}$, we have $g_t(T) = \int_{|\lambda| \leq 1} \lambda d\mu_T(\lambda)$ (see, e.g. [2]). Let $A$ be the complement of $A \subseteq C, R := \{\lambda \in C : |\text{Re}(\lambda)| \leq 1/t\}$ and $I := \{\lambda \in C : |\text{Im}(\lambda)| \leq 1/t\}$. For any Borel set $B \subseteq \mathbb{R}$, we have $\int_B \lambda d\mu_{\text{Re}(T)}(\lambda) = \int_{\text{Re}(\lambda) \in B} \text{Re}(\lambda) d\mu_T(\lambda), \int_B \lambda d\mu_{\text{Im}(T)}(\lambda) = \int_{\text{Im}(\lambda) \in B} \text{Im}(\lambda) d\mu_T(\lambda)$ and so

$$
\int_{\hat{Q}} \lambda d\mu_T(\lambda) = \int_{\text{Re}(\lambda) \in \hat{Q}} \text{Re}(\lambda) d\mu_T(\lambda) + i \int_{\text{Im}(\lambda) \in \hat{Q}} \text{Im}(\lambda) d\mu_T(\lambda)
$$

$$
= \int_{\hat{R}} \text{Re}(\lambda) d\mu_T(\lambda) + \int_{\hat{I}} \text{Re}(\lambda) d\mu_T(\lambda) + i \int_{\hat{I}} \text{Im}(\lambda) d\mu_T(\lambda) + i \int_{\hat{R} \cap \hat{I}} \text{Im}(\lambda) d\mu_T(\lambda)
$$

where $\hat{Q}, \hat{R}, \hat{I}$ are measurable sets and $\hat{Q} = \{\lambda \in \mathbb{R}^2 : |x| \leq a, |y| \leq a\} \forall t > 0$. If $T$ is measurable, then the $\omega$-limit can be replaced with the true limit.
Lemma 2.10. Theorem 2.11. If \( \frac{Q_t}{b} \) the 
set 
\[ \int_{\{t'\geq 1/t\}} \xi d\mu_{Re(T)}(\xi) + \int_{\{t'\geq 1/t\}} Re(\lambda) d\mu_T(\lambda) + i \int_{\{t'\geq 1/t\}} \xi d\mu_{Im(T)}(\xi) + i \int_{\{t'\geq 1/t\}} Im(\lambda) d\mu_T(\lambda). \]

The sum of the first and the third terms in the expression above gives \( \tau_\omega(T) \) after taking the \( \omega \)-limit with respect to \( t \to \infty \) (see Lemma 2.7). We shall now show that \( \lim_{t \to \infty} \frac{1}{\log(1+t)} \int_{\{\lambda \geq 1/t\}} \lambda d\mu_T(\lambda) = 0 \) and \( \lim_{t \to \infty} \frac{1}{\log(1+t)} \int_{\{\lambda \geq 1/t\}} Im(\lambda) d\mu_T(\lambda) = 0. \) We prove the first equality, the second is proved analogously.

In fact, it suffices to prove that \( \lim_{t \to \infty} \frac{1}{\log(1+t)} \int_{\{\lambda \geq 1/t\}} \lambda d\mu_T(\lambda) = 0. \) We have

\[
\left| \int_{\{\lambda \geq 1/t\}} Re(\lambda) d\mu_T(\lambda) \right| \leq \frac{1}{t} \int_{\{\lambda \geq 1/t\}} d\mu_T(\lambda) \leq \frac{1}{t} \int_{\{\lambda \geq 1/t\}} d\mu_T(\lambda) = \frac{1}{t} \int_{1/t}^{\infty} d\mu_{Im(T)}(\xi)
\]

The last inequality follows from the equivalence of \( \mu_{C_1}(T) \leq 1/t \) and \( \lambda_1(1/T) \leq C. \) For the case of measurable \( T, \) the proof is the same. \( \square \)

Lemma 2.9. Let \( T \) be a normal operator from \( L^1, w \) and \( G \) be a bounded Borel neighborhood of \( 0 \in C. \) Then \( \tau_\omega(T) = \omega \lim_{t \to \infty} \frac{1}{\log(1+t)} \int_{\lambda \notin \{\lambda \geq 1/t\} \cap R_t} \lambda d\mu_T(\lambda). \) If \( T \) is measurable, then the \( \omega \)-limit can be replaced with the true limit.

Proof. For an arbitrary bounded neighborhood \( G \) of \( 0 \in C \) there exist squares \( Q_a \) and \( Q_b \) such that \( Q_a \subseteq G \subseteq Q_b. \) Hence, Lemma 2.8 implies that it is sufficient to prove that

\[
\lim_{t \to \infty} \frac{1}{\log(1+t)} \int_{Q_b \setminus Q_a} |\lambda| d\mu_T(\lambda) = 0.
\]

The set \( Q_{1/b} \setminus Q_{1/a} \) consists of four trapeziums and it is sufficient to prove the above limit for one of them, \( D_t := \{z \in Q_{1/b} \setminus Q_{1/a} : Re(tz) \in [a, b]\}, \) for example. We have

\[
\frac{1}{2} \int_{D_t} |\lambda| d\mu_T(\lambda) \leq \int_{Re(\lambda) \in [a, b]} Re(\lambda) d\mu_T(\lambda) = \int_{Re(\lambda) \in [a, b]} \lambda_1 d\lambda = \int_a^b \mu s ds \leq \int_0^b \mu s ds.
\]

By Lemma 2.5, we can replace upper limits \( \lambda_{a/b} \) and \( \lambda_{b/a} \) by \( t/a \) and \( t/b \) respectively. Then \( \int_0^b \mu s ds - \int_0^t \int_0^s \mu r dr ds \leq \int_0^t \int_0^s \mu r dr ds \leq C \log \frac{b}{a} \). \( \square \)

The following lemma follows from [8].

Lemma 2.10. If \( S \in L^1, w \) then there exists a normal operator \( T \in L^1, 1 \) such that the Brown spectral measures of \( S \) and \( T \) coincide and \( \tau_\omega(S) = \tau_\omega(T). \)

The proof of the following theorem (which is the main result of this note) follows from Lemmas 2.9 and 2.10.

Theorem 2.11. If \( S \in L^1, w \) and \( G \) is a bounded Borel neighborhood of \( 0 \in C, \) then \( \tau_\omega(S) = \omega \lim_{t \to \infty} \frac{1}{\log(1+t)} \int_{\lambda \notin \{\lambda \geq 1/t\} \cap R_t} \lambda d\mu_S(\lambda). \) If \( S \) is measurable, then the \( \omega \)-limit can be replaced with the true limit.

We specialize the result above to the case when \( N \) is an infinite-dimensional factor of type \( I_\infty. \)
Corollary 2.12. Let $T$ be a compact operator on an infinite-dimensional Hilbert space $\mathcal{H}$ such that $\mu_n(T) \leq C/n$, $n \geq 1$, for some $C > 0$. If $\lambda_1, \lambda_2, \ldots$ is the list of eigenvalues of $T$ counting the multiplicities such that $|\lambda_1| \geq |\lambda_2| \geq \cdots$, then

$$\text{Tr}_\omega(T) = \omega \lim_{t \to \infty} \frac{1}{\log(1 + t)} \sum_{\lambda \in \sigma(T) \setminus G} \frac{1}{N} \sum_{i=1}^{N} \lambda_i,$$

where $\mu_T(\lambda)$ is the algebraic multiplicity of the eigenvalue $\lambda$. If $T$ is measurable then the $\omega$-limit can be replaced with the true limit.

Proof. The first equality is an immediate consequence of Theorem 2.11. By Lemma 2.10, it is sufficient to prove the second equality for a normal operator $T$. Let $G := \{z \in \mathbb{C} : |z| < 1\}$. It is enough to show that $\sum_{k \in B_N} |\lambda_k| < \text{const}$, where $A_N = \{k \in \mathbb{N} : k \leq N, |\lambda_k| \leq 1/N\}$ and $B_N = \{k \in \mathbb{N} : k > N, |\lambda_k| > 1/N\}$. We have, $\sum_{k \in A_N} |\lambda_k| \leq 1$. That $\sum_{k \in B_N} |\lambda_k|$ is bounded follows from the condition $|\lambda_k| < C/k$, $k \in \mathbb{N}$, for some $C > 0$ and estimate (8). \hfill $\Box$

The following corollary follows from the combination of Corollary 2.12 and [5, Proposition IV.2.5].

Corollary 2.13 [9, Proposition 1]. If $M$ is a compact Riemannian $n$-manifold and $T$ is a pseudodifferential operator of order $-n$ on $M$, then $\text{Tr}_\omega(T) = \lim_{N \to \infty} \frac{1}{\log N} \sum_{k=1}^{N} \lambda_k$.

Let $N = L^\infty(\mathbb{R}^n) \otimes \mathbb{R}_\text{discr}^n$ and let $T^\varepsilon$ be (the image of) an almost periodic pseudodifferential operator of order $-n$ (see, for example, [12]). Then $T^\varepsilon \in \mathcal{L}^{1,w}$.

Corollary 2.14. $\tau_\omega(T^\varepsilon) = \omega \lim_{\varepsilon \to 0+} \frac{1}{\log(1/\varepsilon)} \int |\lambda| > 1/\varepsilon \lambda \, d\mu_T(\lambda)$.

Acknowledgements

The authors thank Nigel Kalton for explaining results from [8], in particular for indicating the proof of Lemma 2.10. We also thank Thierry Fack for useful discussions.
