A note on functional equations of the $p$-adic polylogarithms

<http://www.numdam.org/item?id=BSMF_1991__119_3_343_0>
A NOTE ON FUNCTIONAL EQUATIONS OF
THE P-ADIC POLYLOGARITHMS

BY

ZDZISLAW WOJTKOWIAK (*)

0. Introduction

Let \( n \) be an integer. The series \( \sum_{k=1}^{\infty} \frac{z^k}{k^n} \) converges on the open unit disc around 0 in the field of complex numbers \( \mathbb{C} \). Hence it determines an analytic function on this disc. This function can be extended by an
analytic continuation to a multivalued analytic function on $\mathbb{C} \setminus \{0,1\}$. We denote this function by $\text{Li}_n(z)$ and we call it the $n$-th order polylogarithm.

The functions $\text{Li}_n(z)$ are special cases of Chen iterated integrals (see [Ch]). We recall their definition. Let $\omega_1, \ldots, \omega_n$ be one-forms on a smooth manifold $M$ and let $\gamma : [0,1] \to M$ be a smooth path from $x$ to $z$. Let $\gamma^t : [0,1] \to M$ be a restriction of $\gamma$. We define by a recursive formula

$$
\int_\gamma \omega_1, \ldots, \omega_n := \int_\gamma \left( \int_{\gamma^1} \omega_1 \right) \omega_2, \ldots, \omega_n.
$$

If $x$ is fixed and $\omega_1, \ldots, \omega_n$ are closed one-forms on $M$ such that all possible products $\omega_1 \wedge \cdots \wedge \omega_i$ vanish, then $F(z) = \int_\gamma \omega_1, \ldots, \omega_n$ is an analytic multivalued function on $M$. We shall write also $\int_{x,\gamma} \omega_1, \ldots, \omega_n$ or $\int_x^z \omega_1, \ldots, \omega_n$ to denote the multivalued function $F(z)$.

It is clear that $\text{Li}_n(z) = \int_0^z \frac{dz}{1-z}, \frac{dz}{z}, \ldots, \frac{dz}{z}$.

Let $p$ be a finite prime of $\mathbb{Q}$ and let $\mathbb{C}_p$ denote a completion of an algebraic closure of $\mathbb{Q}$ at some place above $p$. Then the series

$$
\ell_{n,p}(z) = \sum_{k=1}^{\infty} \frac{z^k}{k^n}
$$

determines an analytic function on the open unit disc around 0 in $\mathbb{C}_p$. However one cannot use analytic continuation to extend this function because the open unit disc is the maximal analytic domain for it.

The global $p$-adic analogs of $\text{Li}_n(z)$ are constructed in the framework of rigid analysis. Our basic reference is the paper of Coleman (see [C]). We briefly sketch the necessary results from [C], asking the reader to consult [C] for any details.

To define iterated integrals in the $p$-adic realm we consider the following system of differential equations

\begin{align*}
(*) \quad f'_1 &= \frac{1}{z-a_1}, \quad f'_2 = \frac{f_1}{z-a_2}, \ldots, \quad f'_n = \frac{f_{n-1}}{z-a_n}. \\
\text{Let } a \in \mathbb{C}_p \setminus \{a_1, \ldots, a_n\}. \text{ We pose the following initial conditions} \\
(**) \quad f_1(a) &= 0, \quad f_2(a) = 0, \ldots, \quad f_n(a) = 0.
\end{align*}

We set $D = \mathbb{C}_p \setminus \{a_1, \ldots, a_n\}$. The following result is the direct consequence of [C] (Theorem 4.3, Lemma 5.2 and the whole section V in [C]).
**Theorem A.** — Let us choose a locally analytic homomorphism

$$\log : C_p^* \to C_p.$$

There exists a logarithmic $F$-cristal $M(D)$ on $D = C_p \setminus \{a_1, \ldots, a_n\}$ such that the system of differential equations (*) has a unique solution $f_1(z), \ldots, f_n(z)$ in $M(D)$ which satisfies the initial conditions (**).

It follows from the theory presented in [C] that the functions $f_k(z)$ are locally analytic. The function $f_n(z)$ we shall denote by

$$\int_a^z \frac{dz}{z-a_1}, \frac{dz}{z-a_2}, \ldots, \frac{dz}{z-a_n}$$

and we shall call it an *iterated integral* in the $p$-adic realm.

The $p$-adic polylogarithms are defined in the section VI of [C]. We recall here their definition. Let $D = C_p \setminus \{0,1\}$. We consider the following system of differential equations

\begin{align*}
\ell_1' &= \frac{1}{z - 1}, & \ell_2' &= \frac{\ell_1}{z}, & \ldots, & \ell_n' &= \frac{\ell_{n-1}}{z}.
\end{align*}

We pose the following initial conditions

\begin{align*}
(**_2) & \quad \ell_k(0) = 0.
\end{align*}

**Theorem A'.** — Let us choose a locally analytic homomorphism $\log : C_p^* \to C_p$. Then there exists a logarithmic $F$-crystal $M(D)$ on $D = C_p \setminus \{0,1\}$ such that the system of differential equations (*) has a unique solution $\ell_1(z), \ldots, \ell_n(z)$ in $M(D)$ which satisfies the initial condition (**). The function $\ell_k(z)$ extends to a locally analytic function on $C_p \setminus \{1\}$ such that $\ell_k(0) = 0$.

We shall denote $\ell_k(z)$ by $\text{Li}_k(z)$ and we shall call it the $k$-th $p$-adic polylogarithm. The function $\text{Li}_k(z)$ is analytic at 0 and has the convergent Taylor expansion

$$\sum_{n=1}^{\infty} \frac{z^n}{n^k}$$

at 0. In fact we shall use only the fact that functions $\text{Li}_n(z)$ and $\int_a^z \frac{dz}{z-a_1}, \ldots, \frac{dz}{z-a_n}$ exist in the $p$-adic realm, that they are locally analytic, that their Taylor power series at some points "coincide" with the Taylor power series of the corresponding complex functions and that the logarithmic $F$-crystal, where live $p$-adic iterated integrals satisfies a uniqueness principal.
The complex polylogarithms $\text{Li}_n(z)$ have a lot of remarkable properties. For example, for small $n$, they have functional equations which generalize the functional equation

$$\log xy = \log x + \log y$$

satisfied by the logarithm. The dilogarithm

$$\text{Li}_2(z) = \int_0^z \frac{-\log(1 - t)}{t} \, dt$$

satisfies the functional equation

$$\text{Li}_2\left(\frac{x}{1 - x} \cdot \frac{y}{1 - y}\right) = \text{Li}_2\left(\frac{y}{1 - x}\right) + \text{Li}_2\left(\frac{x}{1 - y}\right) - \text{Li}_2(x) - \text{Li}_2(y) - \log(1 - x) \log(1 - y)$$

(see [A]). In Lewin's book one can find more examples (see [L1]). The basic reference for $p$-adic polylogarithms is the paper of Coleman (see [C]). For more general review of various aspects of polylogarithms and iterated integrals one can consult [Ca].

In this paper we give some sufficient and necessary conditions to have functional equations of polylogarithms. We discuss complex polylogarithms and $p$-adic polylogarithms as well. One of the main results is the following theorem.

**Theorem.** Let $K$ be the field of complex numbers or a $p$-adic completion of the algebraic closure of $\mathbb{Q}$ at some place above $p$. Let

$$f_i : X = \mathbb{P}^1(K) \setminus \{a_1, \ldots, a_n\} \to Y = \mathbb{P}^1(K) \setminus \{0, 1, \infty\}$$

$(i = 1, \ldots, N)$ be regular maps. Let $n_1, \ldots, n_N$ be integers. There is a functional equation

$$\sum_{i=1}^N n_i \text{Li}_{n_i}(f_i(z)) + \text{terms of lower degrees} = 0$$

if and only if $\sum_{i=1}^N n_i(f_i)_* = 0$ in the group

$$\text{Hom}\left(\Gamma^n(\pi_1(X, x)_{\text{et}}^\ell)/\Gamma^{n+1}(\pi_1(X, x)_{\text{et}}^\ell); \Gamma^n(\pi_1(Y, y)_{\text{et}}^\ell)/(\Gamma^{n+1}(\pi_1(Y, y)_{\text{et}}^\ell) + L_n)\right)$$

TOME 119 — 1991 — n° 3
where \( \pi_1(X, x)^\ell_{\text{et}} \) is the \( \ell \)-profinite quotient of the etale fundamental group of \( X \) and where \( (f_i)_\ast \) are maps induced by \( f_i \) on the etale fundamental groups. \( L_n \) is a closed subgroup of \( \Gamma^n(\pi_1(Y, y)^\ell_{\text{et}}) \) defined in the following way. If \( K \) is the field of complex numbers \( \mathbb{C} \), then \( L_n \) is topologically generated by all commutators in \( \pi_0 \) (loop around 0) and \( \pi_1 \) (loop around 1) which contain \( \pi_1 \) at least twice. If \( K \) is a non-Archimedean field \( \mathbb{C}_p \) then any isomorphism \( \mathbb{C}_p \approx \mathbb{C} \) induces an isomorphism

\[
\pi_1 \left( P^1(\mathbb{C}_p) \setminus \{0, 1, \infty\}, y \right)^\ell_{\text{et}} \cong \pi_1 \left( P^1(\mathbb{C}) \setminus \{0, 1, \infty\}, y \right)^\ell_{\text{et}}
\]

and \( L_n \subset \Gamma^n \left( \pi_1 \left( P^1(\mathbb{C}_p) \setminus \{0, 1, \infty\} \right)^\ell_{\text{et}} \right) \) is the image of

\[
L_n \subset \Gamma^n \left( \pi_1 \left( P^1(\mathbb{C}) \setminus \{0, 1, \infty\} \right)^\ell_{\text{et}} \right)
\]

under this isomorphism.

We give also a sufficient and necessary condition to have a functional equation in terms of a differential Galois group of a certain system of differential equations.

**Acknowledgement**

We would like to thank very much P. Deligne who showed us the connection from section 1 in the special case of \( \mathbb{C} \setminus \{0, 1\} \). He also reinterpreted our results from [W1] in terms of Lie algebras of fundamental groups.

We would like to thank very much J.-L. Loday and Ch. Soulé who told us about functional equations of polylogarithms.

We express our gratitude to Y. André who discuss with us \( p \)-adic situation and to L. Lewin for correspondence.

We acknowledge also the influence of the lecture of Zagier (Bonn, April 1989, see also [Z2] and [Z3]) and of the papers [R], [S] and [C].

This paper grew out of preprints [W1] and [W2]. We would like to point the attention to our preprint [W3] which, we hope, will be a chapter of a book "Properties of polylogarithms" of various authors, where we discuss functional equations of complex polylogarithms.

In the present paper we concentrate mostly on a \( p \)-adic situation, though quite often to prove something about \( p \)-adic polylogarithms, we must show an analogous result about complex polylogarithms first.

We point also that in some aspects the \( p \)-adic situation is simpler than the complex situation. The reader can look in chapter 4 where the results are due to the absence of \( 2\pi i \) in a non-archimedean field \( \mathbb{C}_p \).

4. Sometimes it is easier without $2\pi i$

1. Canonical unipotent connection on a projective line minus several points

If $p$ is any prime of $\mathbb{Q}$ let $\mathbb{C}_p$ denote a completion of an algebraic closure of $\mathbb{Q}$ at some place above $p$. This definition includes also the case when $p = \infty$ and then $\mathbb{C}_p = \mathbb{C}$ is the field of complex numbers.

Let $X = P^1(\mathbb{C}_p) \setminus \{a_1, \ldots, a_{n+1}\}$. Observe that $X$ is an affine algebraic variety over $\mathbb{C}_p$. Let $\Omega^*(X)$ be the algebraic De Rham complex of smooth, algebraic differential forms on $X$. Let $A^1(X)$ be a $\mathbb{C}_p$-subspace of $\Omega^1(X)$ generated by linear combinations with $\mathbb{C}_p$-coefficients of one forms $\frac{dz}{z - a_i}$ for $i = 1, \ldots, n + 1$. Observe that

$$A^1(X) = H^1_{DR}(X).$$

Let $H(X)$ be the dual of the $\mathbb{C}_p$-vector space $A^1(X)$. Let $\text{Lie}(H(X))$ be a free Lie algebra over $\mathbb{C}_p$ on $H(X)$. Let

$$L(X) := \lim_{\rightarrow} \left( \text{Lie}(H(X))/\Gamma^n \text{Lie}(H(X)) \right)$$

be the completion of $\text{Lie}(H(X))$ with respect to the filtration given by the lower central series. We equipped $L(X)$ with a group law given by the Baker-Campbell-Hausdorff formula and a topology given by the inverse limit of finite dimensional $\mathbb{C}_p$-vector spaces with its natural $p$-adic topology if $p < \infty$ and the complex topology if $p = \infty$. We shall denote by $\pi(X)$ this topological group. Observe that each quotient $\pi(X)/\Gamma^n \pi(X)$ is an affine algebraic group, so $\pi(X)$ is an affine pro-algebraic group and $L(X)$ is its Lie algebra.

**Definition.** — The one form $\omega_X \in A^1(X) \otimes H(X)$ corresponds to $\text{id}_{A^1(X)}$ under the natural isomorphism

$$A^1(X) \otimes (A^1(X))^* \approx \text{Hom}(A^1(X), A^1(X)).$$

**Tome 119 — 1991 — n° 3**
We consider $\omega_X$ as an element of $A^1(X) \otimes L(X)$.

Let $T(H(X))$ be a tensor algebra over $\mathbb{C}_p$ on $H(X)$. Let $I$ be an augmentation ideal of $T(H(X))$ and let

$$T[[H(X)]] := \lim_{\text{lim}} T(H(X))/I^n$$

be the completed tensored algebra. Observe that $T(H(X))/I^n$ is a finite dimensional vector space over $\mathbb{C}_p$. Hence $T[[H(X)]]$ is equipped with the topology of an inverse limit of finite dimensional $\mathbb{C}_p$-vector spaces. Let $P(X)$ be a group of invertible elements in $T[[H(X)]]$ with leading term equal 1. From the discussion given above it follows that $P(X)$ is affine, pro-algebraic group over $\mathbb{C}_p$.

Remark. — $T[[H(X)]]$ is nothing else but an algebra of non-commutative formal power series over $\mathbb{C}_p$ on $H(X)$.

In $T(H(X))$ and $T[[H(X)]]$ we consider the Lie algebras of Lie elements (possibly of infinite length in a case of $T[[H(X)]]$). These Lie algebras are naturally isomorphic with $\text{Lie}(H(X))$ and $L(X)$ respectively. After the identification of $L(X)$, which is the underlying set of $\pi(X)$ with the Lie elements (possibly of infinite length) in $T[[H(X)]]$ the exponential map

$$\exp : \pi(X) \rightarrow P(X)$$

is defined by the standard formula

$$\exp(w) = 1 + \frac{w}{1!} + \frac{w^2}{2!} - \cdots$$

where we consider $w \in \pi(X)$ as a Lie element in $T[[H(X)]]$. The exponential map is a continuous monomorphism of topological groups, whose image is a closed subgroup of $P(X)$.

The inverse of $\exp$ is defined on the subgroup $\exp(\pi(X))$ of $P(X)$ and it is given by the formula

$$\log z = (z - 1) - \frac{1}{2}(z - 1)^2 + \frac{1}{3}(z - 1)^3 - \frac{1}{4}(z - 1)^4 + \cdots$$

and homomorphisms $\exp$ and $\log$ are mutually inverse isomorphisms

$$\exp : \pi(X) \leftrightarrow \text{im}(\exp) : \log.$$

Let $p(X)$ be a Lie algebra of $P(X)$. We identify $v \in H(X)$ with a tangent vector to $P(X)$ given by $[0, 1] \ni t \mapsto 1 + t \cdot v \in P(V)$ if $\mathbb{C}_p = \mathbb{C}$.
is the field of complex numbers and by the differentiation in the direction of \( v \) if \( \mathbb{C}_p \) is arbitrary.

After this identification we shall consider \( \omega_X \) as an element of \( A^1(X) \otimes p(X) \) and provisionally we shall denote it by

\[
\tilde{\omega}(X) \in A^1(X) \otimes p(X).
\]

**Lemma 1.2.** — *The morphism \( \text{id} \times \exp : X \times \pi(X) \to X \times P(X) \) maps \( \omega_X \) into \( \tilde{\omega}_X \).*

*Proof.* — Let \( v \in H(X) \). Then \( \exp(tv) \) and \( 1 + tv \) define the same tangent vector. If \( \mathbb{C}_p \) is non-archimedean one observes that \( \exp \) transforms the differentiation in the direction of \( v \) on \( \pi(X) \) in the differentiation in the direction of \( v \) on \( P(X) \).

It is clear that there is no need to distinguish between \( \omega_X \) and \( \tilde{\omega}_X \), hence we shall denote both forms by \( \omega_X \).

Let \( X = P^1(\mathbb{C}_p) \setminus \{x_1, \ldots, x_{r+1}\} \) and let \( Y = P^1(\mathbb{C}_p) \setminus \{y_1, \ldots, y_{s+1}\} \). Let

\[
f(z) = \alpha \prod_{i=1}^{n} (z - a_i)^{n_i} / \prod_{j=1}^{m} (z - b_j)^{m_j}
\]

be a rational function. Let us assume that \( f \) restricts to a regular map \( f : X \to Y \). Then \( f \) induces

\[
f^* : A^1(Y) \to A^1(X) \quad \text{and} \quad f_* : H(X) \to H(Y).
\]

The map \( f_* \) induces the following five maps which we shall denote by the same letter \( f_* \):

\[
\begin{align*}
f_* : \text{Lie}(H(X)) & \to \text{Lie}(H(Y)) ; \\
f_* : L(X) & \to L(Y), \quad f_* : \pi(X) \to \pi(Y); \\
f_* : p(X) & \to p(Y), \quad f_* : P(X) \to P(Y).
\end{align*}
\]

Hence \( \pi(\cdot) \) and \( P(\cdot) \) are functors on the category of pointed projective lines and regular maps. We shall denote by \( G(\cdot) \) any of them. In this way we avoid formulations of separated statements for \( \pi(\cdot) \) and for \( P(\cdot) \).

**Lemma 1.3.** — *Let \( X, Y \) and \( f : X \to Y \) be as above. Let*

\[
f \times f_* : X \times G(X) \to Y \times G(Y)
\]
be induced by \( f \). Then we have

\[(\text{id} \otimes f^*) \omega_X = (f^* \otimes \text{id}) \omega_Y,\]

where \( f^* : A^1(Y) \to A^1(X) \).

**Proof.** — The form \( \omega_X \) (resp. the form \( \omega_Y \)) corresponds to \( \text{id}_{A^1(X)} \) (resp. to \( \text{id}_{A^1(Y)} \)). The lemma follows immediately if we observe that \( \text{id}_{A^1(X)} \circ f^* = f^* \circ \text{id}_{A^1(Y)} \).

### 2. Horizontal sections of the canonical connection

Let \( X = P^1(C_p) \setminus \{a_1, \ldots, a_{n+1}\} \). Let us consider a principal \( P(X) \)-bundle

\[X \times P(X) \to X\]

equipped with the integrable connection given by \( \omega_X \).

Let us choose a base of \( A^1(X) \) given by one-forms

\[\omega_1 = T_1(z) \, dz, \quad \ldots, \quad \omega_n = T_n(z) \, dz.\]

Let \( X_1, \ldots, X_n \) be a dual base of \( H(X) \). Then \( P(X) \) is a multiplicative group of non-commutative, formal power series with constant terms equal 1 in non-commutative variables \( X_1, \ldots, X_n \).

Let \( p \) be a finite prime. Let us choose a locally analytic homomorphism \( \log : C_p^* \to C_p \). Then it follows from section 0 (THEOREM A) that there is a logarithmic \( F \)-crystal \( M(X) \) on \( X \) such that iterated integrals

\[\int_{x}^{\infty} \omega_i, \ldots, \omega_m \ (x \in X, i_1, \ldots, i_m \in \{1, 2, \ldots, n\})\]

exist in \( M(X) \).

**Proposition 2.1.** — Let \( p \) be any prime of \( \mathbb{Q} \). Let

\[X = P^1(C_p) \setminus \{a_1, \ldots, a_{n+1}\}\]

and let \( x \in X \). Let \( \omega_1, \ldots, \omega_n \) and \( X_1, \ldots, X_n \) be as above.

(i) Let \( p \) be a finite prime. Then the map

\[W \ni z \mapsto (z, 1 + \sum \{(-1)^k \int_{x}^{\infty} \omega_{i_1}, \ldots, \omega_{i_k} \} X_{i_k} \cdots X_{i_1}) \in X \times P(X)\]

(the summation is over all non-commutative monomials in \( X_1, \ldots, X_n \)) is a horizontal section of a principal \( P(X) \)-bundle \( X \times P(X) \to X \) equipped with an integrable connection given by \( \omega_X \). We shall denote this map shortly by

\[X \ni z \mapsto (z, \lambda_X(z; x)) \in X \times P(X).\]
(ii) Let $C_p$ be the field of complex numbers $\mathbb{C}$. Let $\gamma$ be a path in $X$ from $x$ to $z$. Then the map

$$X \ni z \mapsto \left( z, 1 + \sum \left\{ (-1)^k \int_{x, \gamma}^z \omega_{i_1}, \ldots, \omega_{i_k} \right\} X_{i_k} \cdots X_{i_1} \right) \in X \times P(X)$$

is a horizontal section of a principal $P(X)$-bundle $X \times P(X) \to X$ equipped with an integrable connection given by $\omega_X$. We shall denote this map shortly by

$$X \ni z \mapsto (z, \lambda_X(z; x, \gamma)) \in X \times P(X)$$
or by

$$X \ni z \mapsto (z, \lambda_X(z; x)) \in X \times P(X).$$

(iii) The initial condition $\lambda_X(x; x) = 1$ determines $\lambda_X(z; x)$ (and $\lambda_X(z; x, \gamma)$ if $C_p = \mathbb{C}$) uniquely.

Proof. — The system of differential equations for the coefficient $f_k(z)$ at $X_{i_k} \cdots X_{i_2} \cdot X_{i_1}$ of the horizontal section is the following

\[ (*) \quad d f_1 = -\omega_{i_1}, \quad d f_2 = -f_1 \omega_{i_2}, \quad \ldots, \quad d f_k = -f_{k-1} \omega_{i_k} \]

with the initial condition

$$f_1(x) = 0, \quad f_2(x) = 0, \quad \ldots, \quad f_k(x) = 0.$$ 

If $C_p = \mathbb{C}$ the solution of the system (*) is given by the iterated integrals $(-1)^\ell \int_{x, \gamma}^z \omega_{i_1}, \ldots, \omega_{i_\ell}$ for $\ell = 1, \ldots, k$ where $\gamma$ is a path from $x$ to $z$. If $p$ is finite then the functions $(-1)^\ell \int_{x}^z \omega_{i_1}, \ldots, \omega_{i_\ell}$, $\ell = 1, \ldots, k$, exist in the logarithmic $F$-crystal $M(X)$ and satisfy the system (*).

The uniqueness principal is valid for analytic functions on a connected open set in the complex situation and for functions in $M(X)$ in the $p$-adic situation (see [C], Theorem 5.7). This implies (iii).

We shall denote by

$$X \ni z \mapsto (z, \ell_X(z; x)) \in X \times \pi(X)$$

a horizontal section of a principal $\pi(X)$-bundle $X \times \pi(X) \to X$ equipped with the connection form $\omega_X$ which satisfies the initial condition $\ell_X(x; x) = 0$. If $C_p = \mathbb{C}$ we shall also write $\ell_X(z; x, \gamma)$ instead of $\ell_X(z; x)$ to indicate the dependence on a path $\gamma$. It follows from Lemma 1.2 that

$$\exp(\ell_X(z; x)) = \lambda_X(z; x).$$

Hence we have

$$\ell_X(z; x) = \log(\lambda_X(z; x)).$$

This implies that $\ell_X(z; x)$ exists (in $M(X)$ if $p$ is finite) and it is uniquely determined by the initial conditions.
Corollary 2.2.

Let $X = P^1(C_p) \setminus \{a_1, \ldots, a_{n+1}\}$ and let $Y = P^1(C_p) \setminus \{b_1, \ldots, b_{m+1}\}$. Let $f : X \to Y$ be a regular map. The map $f \times f_* : X \times G(X) \to Y \times G(Y)$ maps horizontal sections of the bundle $X \times G(X) \to X$ equipped with the connection $\omega_X$ into horizontal sections of the bundle $Y \times G(Y) \to Y$ equipped with the connection $\omega_Y$. i.e. we have

\begin{equation}
(2.2.1) \quad f_* (\ell_X(z;x)) = \ell_Y (f(z); f(x)) \quad \text{if} \quad G(\cdot) = \pi(\cdot)
\end{equation}

and

\begin{equation}
(2.2.2) \quad f_* (\lambda_X(z;x)) = \lambda_Y (f(z); f(x)) \quad \text{if} \quad G(\cdot) = P(\cdot).
\end{equation}

Proof. — The corollary is an immediate consequence of Lemma 1.3 and Proposition 2.1.

3. Functional equations

Let $X$ be a projective line $P^1(C_p)$ minus a finite number of points. We recall from section 1 that $G(X)$ is an affine, pro-algebraic group. Let $\text{Alg}(G(X))$ be an algebra of polynomial $C_p$-valued functions on $G(X)$.

Let $X = P^1(C_p) \setminus \{a_1, \ldots, a_{n+1}\}$ and $Y = P^1(C_p) \setminus \{b_1, \ldots, b_{m+1}\}$. Let $f : X \to Y$ be a regular map. Let $x, z \in X$. Our principal tool to derive functional equations are equalities from Corollary 2.2

\begin{equation}
(2.2.1) \quad f_* (\ell_X(z;x)) = \ell_Y (f(z); f(x))
\end{equation}

and

\begin{equation}
(2.2.2) \quad f_* (\lambda_X(z;x)) = \lambda_Y (f(z); f(x)).
\end{equation}

Theorem 3.1. — Let $f_1, \ldots, f_N$ be regular functions. Let $T_1, \ldots, T_N$ belong to $\text{Alg}(G(Y))$ and let $p(t_1, \ldots, t_n)$ be a polynomial in variables $t_1, \ldots, t_n$.

(i) Let $G(\cdot) = \pi(\cdot)$. There is a functional equation

\begin{equation}
(1) \quad p\{T_1(\ell_Y(f_1(z), f_1(x))), \ldots, T_n(\ell_Y(f_N(z), f_N(x)))\} = 0
\end{equation}

if and only if

\begin{equation}
(2) \quad p(T_1 \circ f_1^\ast, \ldots, T_N \circ f_N^\ast) = 0.
\end{equation}

(ii) Let $G(\cdot) = P(\cdot)$. If $p(T_1 \circ f_1^\ast, \ldots, T_N \circ f_N^\ast) = 0$ then

$$p\{T_1(\lambda_Y(f_1(z); f_1(x))), \ldots, T_n(\lambda_Y(f_N(z); f_N(x)))\} = 0.$$
Proof. — Let us assume that we have the identity (2). The identity (2.2.1) implies that

\[ T_i(f_i \cdot (\ell_X(z; x))) = T_i(\ell_Y(f_i(z); f_i(x))). \]

Substituting \( T_i(f_i \cdot (\ell_X(z; x))) \) by \( T_i(\ell_Y(f_i(z); f_i(x))) \) in the formula (2) we get the functional equation (1). The same arguments show also part (ii).

Let us assume that we have a functional equation (1). Let \( \mathbb{C}_p = \mathbb{C} \) be the field of complex numbers. Observe that the subset

\[ \{ \ell_X(x; x, \gamma) \in \pi(X) \mid \gamma \in \pi_1(X, x) \} \]

of \( \pi(x) \) is Zariski dense in \( \pi(X)/\Gamma^2\pi(X) \). Hence this subset is Zariski dense in \( \pi(X)/\Gamma^k\pi(X) \) for any \( k \). The vanishing of a regular function \( p(T_1 \circ f_1, \ldots, T_N \circ f_N) \) on a Zariski dense subset implies that this regular function is the zero function.

Now we shall assume that \( p \) is finite. Let us choose an isomorphism of fields \( \alpha : \mathbb{C}_p \cong \mathbb{C} \). If

\[ q(t_1, \ldots, t_n) = \sum a_{i_1, \ldots, i_n}(t_1)^{i_1}(t_2)^{i_2}\ldots (t_n)^{i_n} \in \mathbb{C}_p[[t_1, \ldots, t_n]] \]

then we set

\[ q^\alpha(t_1, \ldots, t_n) := \sum \alpha(a_{i_1, \ldots, i_n})(t_1)^{i_1}(t_2)^{i_2}\ldots (t_n)^{i_n} \in \mathbb{C}[[t_1, \ldots, t_n]]. \]

If \( X = P^1(\mathbb{C}_p) \setminus \{a_1, \ldots, a_{n+1}\} \) then we set

\[ X^\alpha := P^1(\mathbb{C}) \setminus \{\alpha(a_1), \ldots, \alpha(a_{n+1})\}. \]

Let us identify \( \left( \frac{dz}{z-a_i} \right)^* \) with \( \left( \frac{dz}{z-\alpha(a_i)} \right)^* \). After this identification, if \( T \in \text{Alg}(\pi(X)) \) then \( T^\alpha \in \text{Alg}(\pi(X^\alpha)) \).

Let \( q_i(z) \) be a Taylor series of \( T_i(\ell_Y(f_i(z); f_i(x))) \) at \( x \in \mathbb{C}_p \). Then if follows from (1) that \( p(q_1(z), \ldots, q_N(z)) = 0 \) and consequently also \( p^\alpha(q_1^\alpha(z), \ldots, q_N^\alpha(z)) = 0 \). The power series \( q_i^\alpha(z) \) is a Taylor power series of \( T_i^\alpha(\ell_Y \alpha(f_i^\alpha(z), f_i^\alpha(\alpha(x)))) \) at \( \alpha(x) \in \mathbb{C} \). Hence locally, in a neighbourhood of \( \alpha(x) \) we have a functional equation

\[ p^\alpha\left\{ T_1^\alpha(\ell_Y \alpha(f_1^\alpha(z); f_1^\alpha(\alpha(x)))) \right\}, \ldots, T_N^\alpha(\ell_Y \alpha(f_N^\alpha(z); f_N^\alpha(\alpha(x)))) \right\} = 0. \]
By the principle of analytic continuation we have
\[ p^\alpha \left\{ T_1^\alpha \left( \ell_Y \alpha (f_1^\alpha (z); f_1^\alpha (\alpha (x)), f_1^\alpha (\gamma)) \right), \ldots \right\} = 0 \]
for any smooth path \( \gamma \) from \( \alpha (x) \) to \( z \). Hence we have
\[ p^\alpha \left\{ T_1^\alpha \circ f_1^\alpha, \ldots, T_N^\alpha \circ f_N^\alpha \right\} = 0 \]
by the result proved above for the field of complex numbers. This implies
\[ p \{ T_1 \circ f_1, \ldots, T_N \circ f_N \} = 0. \]

We recall that \( \text{Lie } H(Y) \) is a free Lie algebra on
\[ Y_1 = (\omega_1)^*, \ldots, Y_m = (\omega_m)^* \]
where \( \omega_1, \ldots, \omega_m \) is a base of \( A^1(Y) \). We fixed a base \( B_Y \) of \( \text{Lie } H(Y) \) given by basic Lie elements corresponding to the ordering \( Y_1, \ldots, Y_m \) (see \([\text{MKS}], \text{Theorem 5.8})\). Let \( v \in B_Y \) and let \( v^* \in \text{Hom } (\text{Lie } H(Y), \mathbb{C}) \) be a linear functional on \( \text{Lie } H(Y) \) dual to \( v \) with respect to the base \( B_Y \). We consider the linear functional \( v^* \in \text{Lie } H(Y) \) as an element of \( \text{Alg}(\pi(Y)) \). We set
\[ \mathcal{L}_{v, B_Y} (z; x) := v^* (\ell_Y (z; x)). \]

If the choice of the base \( B_Y \) is clear we shall omit the subscript \( B_Y \) and we shall write \( \mathcal{L}_v (z; x) \) instead of \( \mathcal{L}_{v, B_Y} (z; x) \).

The following results are immediate corollaries of Theorem 3.1.

**Corollary 3.2.** — Let \( f_1, \ldots, f_N \) be regular functions, let \( n_1, \ldots, n_N \) be integers and let \( v_1, \ldots, v_N \) be homogeneous of degree \( n \) and let they belong to the base \( B_Y \) of \( \text{Lie}(H(Y)) \). There is a functional equation
\[ \sum_{i=1}^N n_i \mathcal{L}_{v_i} (f_i(z); f_i(x)) = 0 \]
if and only if
\[ \sum_{i=1}^N n_i (v_i^* \circ (f_i)_*) = 0 \]
in \( \text{Hom}(\Gamma^n \pi(X)/\Gamma^{n+1} \pi(X); \mathbb{C}_p) \), where
\[ (f_i)_* : \Gamma^n \pi(X)/\Gamma^{n+1} \pi(X) \longrightarrow \Gamma^n \pi(Y)/\Gamma^{n+1} \pi(Y) \]
induced by \( f_i \).
COROLLARY 3.3. — Let $B_X$ be a base of $\text{Lie} H(X)$ given by basic Lie elements. The functions $\{\mathcal{L}_v(z;x_0) \mid v \in B_X\}$ are algebraically independent on $X$.

Now we shall concentrate on polylogarithms. Let

$$Y = P^1(C_p) \setminus \{0;1;\infty\}.$$ 

Let $B_Y$ be a base of $\text{Lie} H(Y)$ given by basic Lie elements corresponding to the ordering $e_0 = \left(\frac{dz}{z}\right)^*$ and $e_1 = \left(\frac{dz}{z-1}\right)^*$. Let us set $e_2 := [e_1,e_0]$ and $e_{n+1} := [e_n,e_0]$. Let $e_n^*$ denote the linear functional on $\text{Lie} H(Y)$ dual to $e_n$ with respect to the base $B_Y$. We shall consider $e_n^*$ as an element of $\text{Alg}(\pi(Y))$.

We recall that $\mathcal{L}_{e_n}(z;x) = e_n^*(\ell_Y(z;x))$. To simplify notation we set

$$\mathcal{L}_n(z;x) := \mathcal{L}_{e_n}(z;x).$$

Let $\mathcal{T}_n : P(Y) \rightarrow C_p[\{e_0,e_1\}]^* \rightarrow C_p$ associate to an element of $P(Y)$ its coefficient at $e_0^n \cdot e_1$. We set

$$\mathcal{L}_n(z;x) := (-1)^{n-1}\mathcal{T}_{n-1}(\lambda_Y(z;x)).$$

It is an easy observation that

$$\mathcal{L}_n(z;x) = \int_z^{x} \frac{-dz}{z-1}, \frac{dz}{z}, \cdots, \frac{dz}{z},$$

where $dz/z$ appears $(n-1)$ times.

We shall express the function $\mathcal{L}_n(z;x)$ by functions $\mathcal{L}_k(z;x)$. Let

$$\lambda = \exp(\alpha e_0) + \sum_{n=0}^{\infty} b_{n+1} e_0^n e_1 \in P(Y).$$

We recall that

$$\log t = (t-1) - \frac{1}{2}(t-1)^2 + \frac{1}{3}(t-1)^3 - \frac{1}{4}(t-1)^4 + \cdots.$$ 

Let $c_{n+1}$ be a coefficient at $e_0^n \cdot e_1$ in the power series $\log \lambda$. We have

$$c_{n+1} = b_{n+1} - \frac{1}{2} \left( \sum_{1 \leq i \leq n} \frac{a_i}{i!} b_{n+1-i} \right) + \frac{1}{3} \left( \sum_{i+j \leq n} \frac{a_i a_j}{i! j!} b_{n+1-i-j} \right) - \frac{1}{4} \left( \sum_{i+j+k \leq n} \frac{a_{i+j+k}}{i! j! k!} b_{n+1-i-j-k} \right) + \cdots.$$ 

TOME 119 — 1991 — N° 3
We shall compute the coefficient at $a^k b_{n+1-k}$. Observe that this coefficient is equal to a coefficient at $z^k$ in a power series

$$\varphi(z) = -\frac{1}{2} (e^z - 1) + \frac{1}{3} (e^z - 1)^2 - \frac{1}{4} (e^z - 1)^3 + \cdots$$

We have

$$(e^z - 1) + \varphi(z)(e^z - 1) = \log e^z = z.$$

Hence

$$\varphi(z) = \frac{z}{e^z - 1} - 1 = \sum_{n=1}^{\infty} \frac{B_n}{n!} z^n$$

where $B_n$ are Bernoulli numbers ($B_1 = -\frac{1}{2}, B_2 = \frac{1}{12}, B_3 = 0, \ldots$). The immediate consequence of this discussion is the following lemma.

**Lemma 3.4.** — We have

$$c_{n+1} = b_{n+1} + \sum_{k=1}^{n} \frac{B_k}{k!} a^k b_{n+1-k}.$$  

This Lemma implies the following result.

**Corollary 3.5.** — We have

$$L_{n+1}(z; x) = \text{Li}_{n+1}(z; x) + \sum_{k=1}^{n} \frac{B_k}{k!} \left( \int_{x}^{z} \frac{dz}{z} \right)^k \text{Li}_{n+1-k}(z; x).$$

(Observe that $L_2(z) := \text{Li}_2(z) + \frac{1}{2} \log z \log(1 - z)$ is the Rogers function (see [R]).)

**Theorem 3.6.**

Let $X = P^1(C_p) \setminus \{a_1, \ldots, a_{n+1}\}$ and let $Y = P^1(C_p) \setminus \{0, 1, \infty\}$. Let $f_1, \ldots, f_N : X \to Y$ be regular functions and let $n_1, \ldots, n_N$ be integers. There is a functional equation

$$(0) \sum_{i=1}^{N} n_i L_n(f_i(z); f_i(x)) = 0$$

if and only if one of the following equivalent conditions is satisfied:

$$(1) \sum_{i=1}^{N} n_i c^*_n \circ (f_i)_* = 0 \text{ in the group}$$

$$\text{Hom}(\Gamma^n \pi(X) / \Gamma^{n+1} \pi(X); C_p).$$

**Bulletin de la Société Mathématique de France**
\[ (2) \sum_{i=1}^{N} n_i(f_i)_* = 0 \text{ in the group} \]

\[ \text{Hom} \left( \Gamma^n \pi(X) / \Gamma^{n+1} \pi(X); \Gamma^n \pi(Y) / (\Gamma^{n+1} \pi(Y) + L_n) \right), \]

where \( L_n \) is a \( C_p \)-vector subspace of \( \Gamma^n \pi(Y) / \Gamma^{n+1} \pi(Y) \) generated by all commutators in \( e_0 \) and \( e_1 \) which contain \( e_1 \) at least twice;

\[ (3) \sum_{i=1}^{N} n_i(f_i)_* = 0 \text{ in the group} \]

\[ \text{Hom} \left( \Gamma^n(\pi_1(X, x)_\text{et}) / \Gamma^{n+1}(\pi_1(X, x)_\text{et}); \right. \]

\[ \left. \Gamma^n(\pi_1(Y, y)_\text{et}) / (\Gamma^{n+1}(\pi_1(Y, y)_\text{et}) + L_n) \right) \]

where \( \pi_1(X, x)_\text{et} \) is the \( \ell \)-profinite quotient of the etale fundamental group of \( X \) and where \( (f_i)_* \) are maps induced by \( f_i \) on etale fundamental groups. \( L_n \) is a closed subgroup of \( \Gamma^n(\pi_1(Y, y)_\text{et}) \) defined in the following way. If \( C_p \) is the field of complex numbers \( \mathbb{C} \) then \( L_n \) is topologically generated by all commutators in \( e_0 \) (loop around 0) and \( e_1 \) (loop around 1) which contain \( e_1 \) at least twice. If \( C_p \) is a non-archimedean field then any isomorphism \( C_p \approx \mathbb{C} \) induces an isomorphism

\[ \pi_1(P^1(C_p) \setminus \{0, 1, \infty\}, y)_\text{et} \approx (P^1(\mathbb{C}) \setminus \{0, 1, \infty\}, y)_\text{et} \]

and \( L_n \subset \Gamma^n\pi_1(P^1(C) \setminus \{0, 1, \infty\}, y)_\text{et} \) is the image of

\[ L_n \subset \Gamma^n \left( \pi_1(P^1(C) \setminus \{0, 1, \infty\}, y)_\text{et} \right) \]

under this isomorphism.

Proof. — It follows immediately from Corollary 3.2 that (0) and (1) are equivalent. Observe that \( L_n = \ker e^n_* \). This implies that (1) and (2) are equivalent. Observe that the map induced by \( f_i \) on quotient groups \( \Gamma^n \pi(X) / \Gamma^{n+1} \pi(X) \) "coincides" with the map induced by \( f_i \) on \( \Gamma^n(\pi_1(X, x)_\text{et}) / \Gamma^{n+1}(\pi_1(X, x)_\text{et}) \). This implies that conditions (2) and (3) are equivalent.

Definition 3.7. — Let \( n \) be a natural number. We note \( \text{ldt}(n) \) a polynomial in variables \( \text{Li}_k(g_i(z)) \), where \( k < n \) and \( g_i(z) \) are rational functions.
Corollary 3.8. — There is a functional equation

\[
(1) \sum_{i=1}^{N} n_i (\text{Li}_n(f_i(z)) - \text{Li}_n(f_i(x))) + \text{ldt}(n) = 0
\]

if and only if

\[
(2) \sum_{i=1}^{N} n_i (f_i)_* = 0
\]

in the group \(\text{Hom}(\Gamma^n\pi(X)/\Gamma^{n+1}\pi(X); \Gamma^n\pi(Y)/(\Gamma^{n+1}\pi(Y) + L_n))\).

Proof. — Let us assume that \(\sum_{i=1}^{N} n_i (f_i)_* = 0\). Theorem 3.6 implies that \(\sum_{i=1}^{N} n_i \mathcal{L}_n(f_i(z); f_i(x)) = 0\). It is a trivial observation that \(\text{Li}_n(z; x) = \text{Li}_n(z) - \text{Li}_n(x) + \text{ldt}(n)\). Hence Corollary 3.5 implies that

\[
\sum_{i=1}^{N} n_i \left[\text{Li}_n(f_i(z)) - \text{Li}_n(f_i(x))\right] + \text{ldt}(n) = 0.
\]

Let us assume that (1) holds. Let \(\mathbb{C}_p = \mathbb{C}\) be the field of complex numbers. Calculating the monodromy of the function \(\text{Li}_n(z)\) on elements of \(\Gamma^n\pi_1(Y, y)\) we get a linear function \(\hat{e}_n\) from \(\Gamma^n\pi_1(Y, y)/\Gamma^{n+1}\pi_1(Y, y)\) to \((2\pi i)^n \cdot \mathbb{Z}\) which after the identification of \(e_0 \in \pi(Y)\) (resp. \(e_1 \in \pi(Y)\)) with a loop around 0 (resp. loop around 1) coincides with

\[(2\pi i)^n \cdot e_n^*: \Gamma^n\pi(Y)/\Gamma^{n+1}\pi(Y) \to \mathbb{C}.
\]

Calculating the monodromy of \(\text{Li}_n(f_i(z))\) on \(\Gamma^n\pi_1(X, x)\) we get a linear function

\[\hat{e}_n \circ (f_i)_*: \Gamma^n\pi_1(X, x)/\Gamma^{n+1}\pi_1(X, x) \to (2\pi i)^n \cdot \mathbb{Z}\]

where \((f_i)_*: \pi_1(X, x) \to \pi_1(Y, y)\) is the map induced by \(f_i\). The functional equation (1) implies that we have \(\sum_{i=1}^{N} n_i \hat{e}_n \circ (f_i)_* = 0\) in \(\text{Hom}(\Gamma^n\pi_1(X, x)/\Gamma^{n+1}\pi_1(X, x); (2\pi i)^n \mathbb{Z})\). This condition is of course equivalent to (2).

Let \(\mathbb{C}_p\) be a non-archimedean field. We rewrite the equation (1) in the form

\[
\sum_{i=1}^{N} n_i \text{Li}_n(f_i(z); f_i(x)) + \text{ldt}(n) = 0
\]

BULLETIN DE LA SOCIÉTÉ MATHEMATIQUE DE FRANCE
where \( \text{ldt}(n) \) is a polynomial in \( L_k(g_j(z); g_j(x)) \) (here \( k < n \) and \( g_j(z) \) are rational functions) and constants. We replace the functions \( \text{Li}_n(f_i(z); f_i(x)) \) and \( \text{Li}_k(g_j(z); g_j(x)) \) by their Taylor power series at \( x \). We choose an isomorphism \( \alpha : \mathbb{C}_p \approx \mathbb{C} \) and we interpret the Taylor power series over \( \mathbb{C}_p \) as Taylor power series of complex functions \( \text{Li}_k(\; ; ) \). Hence we get a functional equation of complex polylogarithms

\[
\sum_{i=1}^{N} n_i \text{Li}_n(f_i^o(z); f_i^o(x)) + \text{ldt}(n) = 0
\]

and this situation we have already considered.

Now we shall show that the ideal of polynomial relations between functions \( \text{Li}_n(f_i(z)) \), where \( f_i(z) \) are rational functions is generated by linear relations from Theorem 3.6.

Let \( f_1(z), \ldots, f_N(z) \) be rational functions. Let \( p(x_1, \ldots, x_N, t_1, \ldots, t_R) \) be a polynomial whose degree with respect to \( x_1, \ldots, x_N \) is strictly smaller than \( k \). We set

\[
\text{LDT}_k(n) := p\left(\text{Li}_n(f_1(z)), \ldots, \text{Li}_n(f_N(z)), T_1, \ldots, T_R\right)
\]

where \( T_1 = \text{ldt}(n), \ldots, T_R = \text{ldt}(n) \).

We recall that \( I \) is a homogeneous ideal in \( \mathbb{C}_p[x_1, \ldots, x_m] \) if the following two conditions holds:

(i) for any two homogeneous elements in \( I \) of the same degree, their sum is in \( I \);

(ii) for any homogeneous element \( a \) in \( I \) and any homogeneous element \( c \) in \( \mathbb{C}_p[x_1, \ldots, x_m] \), the element \( c \cdot a \) is in \( I \).

**Theorem 3.9.** — Let \( f_1(z), \ldots, f_N(z) \) be rational functions. Let

\[
I_n(f_1, \ldots, f_N)
\]

\[
= \left\{ p(x_1, \ldots, x_N) \in \mathbb{C}_p[x_1, \ldots, x_N] \right. \\
| p(x_1, \ldots, x_N) \text{ homogeneous of degree } k > 0, \\
p(\text{Li}_n(f_1(z)), \ldots, \text{Li}_n(f_N(z))) + \text{LDT}_k(n) = 0 \right\}.
\]

Then \( I_n(f_1, \ldots, f_N) \) is a homogeneous ideal generated by a finite number of linear forms in \( x_1, \ldots, x_N \).
Proof. — It is clear that \( I_n(f_1, \ldots, f_N) \) is a homogeneous ideal. Let \( X = P^1(C_p) \setminus \{a_1, \ldots, a_t\} \) be such that the maps \( f_i : X \to P^1(C_p) \setminus \{0, 1, \infty\} \) are regular for \( i = 1, \ldots, N \). It follows from THEOREM 3.1 and the fact that \( p(x_1, \ldots, x_N) \) is homogeneous that

\[
p(L_i(f_i(z)), \ldots, L_i(f_N(z))) + \text{LDT}_k(n) = 0
\]

if and only if \( p(e^* o (f_1)_*, \ldots, e^* o (f_N)_*) = 0 \) in \( \text{Alg}(\pi(X)) \). This is equivalent to the condition \( p(e^* o (f_1)_*, \ldots, e^* o (f_N)_*) = 0 \) in \( S(V^*) \) where \( V = \Gamma^n\pi(X)/\Gamma^{n+1}\pi(X) \) and \( S(V^*) \) is the symmetric algebra over \( C_p \) on the vector space \( V^* = \text{Hom}(V, C_p) \).

Then \( I_n(f_1, \ldots, f_N) \) is the maximal homogeneous ideal contained in \( \ker(C_p[x_1, \ldots, x_N] \xrightarrow{\pi} S(V^*)) \), where \( \pi(x_i) = e^* o (f_i)_* \). The map \( \pi \) is induced by a linear map \( \bigoplus_{i=1}^N C_p x_i \to V^* \). Hence the ideal \( I_n(f_1, \ldots, f_N) \) is generated by one-forms.

4. Sometimes it is easier without \( 2\pi i \)

In this section \( p \) is a finite prime, so we are working in a \( p \)-adic realm. Let

\[
P_{n+1}(z) = \sum_{i=0}^{n} \alpha_i (\log z)^i L_{i+1-1}(z)
\]

(\( L_i(z) = -\log(1 - z) \)). Let \( V_{n+1} \subset C_p^{n+1} \) be given by

\[
V_{n+1} = \left\{ (a_0, \ldots, a_n) \in C_p^{n+1} \mid \sum_{i=0}^{n} \frac{a_k}{(n+1-k)!} = 0 \right\}.
\]

Lemma 4.1. — Let

\[
\frac{d}{dz} (P_{n+1}(z)) = \alpha_n \left[ \frac{(\log z)^{n-1} \log(1 - z)}{z} + \frac{(\log z)^n}{1 - z} \right]
\]

\[
= \sum_{i=0}^{n-1} \beta_i \frac{(\log z)^i L_{i+1}(z)}{z}.
\]

If \( (\alpha_0, \ldots, \alpha_n) \in V_{n+1} \) then \( (\beta_0, \ldots, \beta_{n-1}) \in V_n \).

Proof. — We have

\[
\beta_k = a_k + (k+1)a_{k+1} \quad \text{if} \quad k < n - 1,
\]

\[
\beta_{n-1} = a_{n-1} + (n+1)a_n.
\]
Hence
\[ \sum_{i=0}^{n-1} \frac{\beta_i}{(n-i)!} = \sum_{i=0}^{n-1} \frac{a_i + (i + 1)a_{i+1}}{(n-i)!} + a_n \]
\[ = \frac{a_0}{n!} + \sum_{i=1}^{n} \frac{(n+1)}{(n+1-i)!}a_i = 0. \]

The $p$-adic $k$-th polylogarithm satisfies the functional equation
\[ \text{(*) } \text{Li}_k\left(\frac{1}{z}\right) = (-1)^{k+1} \text{Li}_k(z) + (-1)^{k+1} \frac{(\log z)^k}{k!} \]
(see [C], Proposition 6.4).

**Lemma 4.2.** — Let $P_{n+1}(z)$ be such that $(\alpha_0, \ldots, \alpha_n) \in V_{n+1}$. Then
\[ P_{n+1}\left(\frac{1}{z}\right) + (-1)^{n+1} P_{n+1}(z) = 0. \]

**Proof.** — This follows immediately from (*).

Following [C], we set
\[ \lim' f(z) = \lim_{z \to a} f(z) \]
if all the limits on the right side exist and coincide, for an arbitrary finitely ramified extension $K$ of $\mathbb{Q}_p$ such that coordinates of $a$ are in $K$.

**Lemma 4.3.** — Let $P_{n+1}(z)$ be such that $(\alpha_0, \ldots, \alpha_n) \in V_{n+1}$. Then
\[ \lim_{z \to 0} P_{n+1}(z) = 0 \text{ and } \lim_{z \to \infty} P_{n+1}(z) = 0. \]

**Proof.** — The fact that $\log z$ is bounded on any finitely ramified extension of $\mathbb{Q}_p$ and $\text{Li}_k(0) = 0$ implies that the first limit vanishes. It follows from Lemma 4.2 that the second limit vanishes.

Now we give some examples of functions $P_{n+1}(z)$ such that the sequence of coefficients $(\alpha_0, \ldots, \alpha_n) \in V_{n+1}$.

**Example 1.** — Let
\[ \alpha_i = \frac{(-1)^i}{i!} \text{ if } i < n \quad \text{and} \quad \alpha_n = \frac{(-1)^n}{n!} + \frac{(-1)^{n+1}}{(n+1)!}. \]

We must show that the expression $\sum_{i=0}^{n+1} (-1)^i/i!(n+1-i)!$ vanishes. Observe that this expression is a coefficient at $z^{n+1}$ in the power series $e^{-z}.e^z = 1$, hence
\[ \sum_{i=0}^{n+1} \frac{(-1)^i}{i!(n+1-i)!} = 0. \]
The function
\[ \sum_{i=0}^{n} \frac{(-1)^i}{i!} (\log z)^i \text{Li}_{n-i}(z) + \frac{(-1)^{n+1}}{(n+1)!} (\log z)^n \text{Li}_1(z) \]
appeared in [L2] while its single valued analogue in [W4].

**Example 2.** Let \( \alpha_i = \beta_i \) where \( \beta_i \) are Bernoulli numbers \( \beta_0 = 1, \beta_1 = -\frac{1}{2}, \beta_2 = \frac{1}{6}, \beta_3 = 0, \ldots \). Observe that \( \sum_{i=0}^{n} \frac{\beta_i}{i!} (n+1-i)! \) is a coefficient at \( z^{n+1} \) in the power series \( \frac{z}{e^z - 1} \cdot (e^z - 1) \), hence
\[ \sum_{i=0}^{n} \frac{\beta_i}{i! (n+1-i)!} = 0. \]

The function \( \sum_{i=0}^{n} \frac{\beta_i}{i!} (\log z)^i \text{Li}_{n+1-i}(z) \) appeared in [D2] and in a non-explicit way in [W2] as a solution of a system of differential equations defining horizontal sections.

**Example 3.** Let
\[ \alpha_0 = 1, \quad \alpha_i = 0 \quad \text{for} \quad 0 < i < n \quad \text{and} \quad \alpha_n = -\frac{1}{(n+1)!}. \]
The corresponding function is \( \text{Li}_{n+1}(z) + \frac{1}{(n+1)!} (\log z)^n \log(1-z) \).

Observe that \( \dim V_{n+1} = n \). Hence for \( n = 1 \) there is only one function (up to a multiplication by a constant) such that its sequence of coefficients belongs to \( V_2 \). This is the Rogers function \( \text{Li}_2(z) + \frac{1}{2} \log(z) \cdot \log(1-z) \).

We hope that a function \( P_{n+1}(z) \) such that its sequence of coefficients \( (\alpha_0, \ldots, \alpha_n) \in V_{n+1} \), has all functional equations without lower degree terms. We give a partial result in this direction. We shall imitate D. Zagier (see [Z1]).

Let \( A_{\text{loc}}(C_p) \) be a ring of functions which are locally analytic on some \( C_p \setminus \) several points. Let \( \text{Sym}^k(C_p(z)^*) \) be the \( k \)-th symmetric power of the multiplicative group \( C_p(z)^* \). Let us set
\[ L_{n+1}(C_p(z)^*) := \text{Sym}^{n-1}(C_p(z)^*) \otimes (C_p(z)^* \wedge C_p(z)^*) \otimes Q/R. \]
where $R$ is generated by expressions of the form
\[(**)
\begin{align*}
& f_1 \circ \cdots \circ f_{n-2} \circ a \circ b \circ c \\
& + f_1 \circ \cdots \circ f_{n-2} \circ b \circ c \circ a \\
& + f_1 \circ \cdots \circ f_{n-2} \circ c \circ a \circ b
\end{align*}
\]
and
\[(***)
\begin{align*}
& c_1 \circ \cdots \circ c_{n-1} \circ c_n \circ c_{n+1}
\end{align*}
\]
where $c_i \in C^*_p$ for $i = 1, \ldots, n + 1$. Let $K_{n+1} : L_{n+1}(C^*_p(z)^*) \to A_{loc}(C_p)$ be given by
\[
K_{n+1}((f_1 \circ f_2 \circ \cdots \circ f_{n-1}) \circ f_n \wedge f_{n+1} \circ \alpha) = \alpha A(f_1) \cdots A(f_{n-1}) \cdot \left( A(f_{n+1}) \cdot B(f_n) - A(f_n) \cdot B(f_{n+1}) \right)
\]
where $A(f) = \log f$ and $B(g) = g'/g$.

Let $\mathcal{B}(C_p(z)^*)$ be a free abelian group on the set $C_p(z)^*$. We shall denote by $[f]$ the generator corresponding to $f \in C_p(z)^*$. Let
\[
b_{n+1} : \mathcal{B}(C_p(z)^*) \to L_{n+1}(C_p(z)^*)
\]
be a homomorphism given by
\[
b_{n+1}([f]) = f \circ \cdots \circ f \circ f \circ 1 - f.
\]

**Proposition 4.4.** — Let
\[
P_{n+1}(z) = \sum_{i=0}^{n} \alpha_i (\log z)^i \text{Li}_{n+1-i}(z)
\]
be such that $(\alpha_0, \ldots, \alpha_n) \in V_{n+1}$. If $f = \sum_{k=1}^{m} n_k [f_k] \in \ker b_{n+1}$, then we have
\[
\sum_{k=1}^{m} n_k \left( P_{n+1}(f_k(z)) - P_{n+1}(f_k(z_0)) \right) = 0
\]
where $z_0$ is a fixed element of $C_p$.

**Proof.** — Let $n = 1$. The space $V_2$ is one-dimensional generated by $(1, -\frac{1}{2})$. Then for $P_2(z) = \text{Li}_2(z) + \frac{1}{2} \log z \log(1 - z)$ we have
\[
\frac{d}{dz} \sum_{k=1}^{m} n_k \left( P_2(f_k(z)) \right) = -\frac{1}{2} \sum_{k=1}^{m} n_k \left\{ \frac{f_k'(z)}{f_k(z)} \log(1 - f_k(z)) \right. \\
- \left. \frac{(1 - f_k(z))'}{1 - f_k(z)} \log(f_k(z)) \right\}
\]
\[
= -\frac{1}{2} K_2(b_2(f)) = 0.
\]
Hence \( \sum_{k=1}^{m} n_k(P_2(f_k(z))) \) is constant. Assume that the theorem holds for \( n \).

We have

\[
\frac{d}{dz} \sum_{k=1}^{m} n_kP_{n+1}(f_k(z)) = \sum_{k=1}^{m} n_k \frac{f'_k(z)}{f_k(z)} \cdot Q_n(f_k(z))
\]

\[
+ \alpha_n \sum_{k=1}^{m} n_k \left\{ \frac{f'_k(z)}{f_k(z)} \left( (\log f_k(z))^{n-1} \log(1 - f_k(z)) \right) \right. 
\]

\[
- \frac{(1 - f_k(z))'}{1 - f_k(z)} \left( \log f_k(z) \right)^n \}
\]

where \( Q_n(z) = \sum_{i=0}^{n-1} \beta_i(\log z)^i \) \( Li_{n-1}(z) \) and

\[
\beta_i = \alpha_i + (i + 1)\alpha_{i+1} \quad \text{if} \quad i < n - 1, \quad \beta_{n-1} = \alpha_{n-1} + (n + 1)\alpha_n.
\]

The second summand is equal to \( \alpha_n K_{n+1}((b_{n+1}(f)) = 0. \) Let \( v_{z-a}(f(z)) \)
be a valuation of a rational function \( f(z) \) at \( z = a \). The first summand
\( \sum n_k f'_k(z)/f_k(z) \cdot Q_n(f_k(z)) \) is equal to

\[
\sum_{a \in C_p \cup \{\infty\}} \frac{1}{z-a} \sum_{k=1}^{m} n_k v_{z-a}(f_k(z)) Q_n(f_k(z)).
\]

For any \( a \in C_p \) the element

\[
\sum_{k=1}^{m} n_k v_{z-a}(f_k(z)) [f_k(z)] \in B(C_p(z)^*)
\]

belongs to \( \ker b_n \). By \textsc{Lemma} \( 4.1 \) and the inductive assumption the expression \( \sum_{k=1}^{m} n_k v_{z-a}(f_k(z)) Q_n(f_k(z)) \) is constant. It follows from \textsc{Lemma} \( 4.3 \) that this constant is zero. Hence \( (d/dz) \sum_{k=1}^{m} n_k P_{n+1}(f_k(z)) \) vanishes and the function \( \sum_{k=1}^{m} n_k P_{n+1}(f_k(z)) \) is constant.

\textsc{Corollary} \( 4.5 \) (Conjectured by L. \textsc{Lewin} (see [L2], pp. 7–8)). — \textit{Let}

\( f = \sum_{i=1}^{N} n_i[f_i(z)] \in B(C_p(z)^*) \) \textit{belong to} \( \ker b_{n+1} \). \textit{The lower degree terms of the functional equation of \( Li_{n+1}(z) \) for \( f \) involve only constants and logarithms.}
Proof. — The sequence \((1, 0, \ldots, 0, -1/(n+1)!)\) belongs to \(V_{n+1}\). Let \(P_{n+1}(z) = \text{Li}_{n+1}(z) + \frac{1}{(n+1)!} \log z \log(1-z)\). It follows from Proposition 4.4 that

\[
\sum_{i=1}^{N} n_i \left( P_{n+1}(f_i(z)) - P_{n+1}(f_i(x)) \right) = 0.
\]

This implies the corollary.

5. Differential Galois groups and functional equations

Let

\[(*)\]

\[X' = AX\]

be a linear system of differential equations on \(P^1(C_p)\) where \(X(z) := (X_1(z), \ldots, X_n(z))\) and \(A(z) = (A_{ij}(z))_{i,j=1,\ldots,n}\). Assume that the elements of the matrix \(A\) are in \(K = C_p(z-a)\). Assume also that the functions \(A_{ij}(z)\) for \(i, j = 1, \ldots, n\) have no poles at \(a \in C_p\). Then there exists \(n\)-solutions \(Y_1, \ldots, Y_n\) of (*) in \(C_p[[z-a]]\) linearly independent over \(C_p\). The subfield \(F = C_p(z-a)(Y_1, \ldots, Y_n)\) of the field of fractions of \(C_p[[z-a]]\) is preserved by the derivation \(\partial = \frac{d}{d(z-a)}\). The differential Galois group of \(F/K\) is the group \(\text{Aut}_\partial(F/K)\) of automorphism of \(F\) which commute with \(\partial\) and fix \(K\) (see [An]).

Our fundamental example is the following system of differential equations

\[(**)\]

\[\begin{aligned}
T_0' &= 0, & \Psi &= \frac{T_0}{z}, \\
T_1' &= \frac{T_0}{1-z}, & T_2' &= \frac{T_1}{z}, & \cdots , & T_n' &= \frac{T_{n-1}}{z}
\end{aligned}\]

with initial conditions \(T_0 = 1, \Psi(a) = 0\) and \(T_k(a) = 0\) for \(k > 0\). Its differential Galois group \(G_n\) is given by the following automorphisms of \(F = C_p(z-a)(\Psi; T_1, \ldots, T_n)\):

\[\Psi \mapsto \Psi + \alpha\]

\[\theta(\alpha, \beta_1, \ldots, \beta_n) :\]

\[T_k \mapsto T_k + \sum_{i=1}^{k} \frac{\beta_i}{(k-i)!} \Psi^{k-i}\]
for \( k = 1, \ldots, n \), where \( \alpha, \beta_1, \ldots, \beta_n \) are independent parameters. Observe that

\[
\theta(\alpha, \beta_1, \ldots, \beta_n) \circ \theta(\alpha', \beta_1', \ldots, \beta_n')
= \theta(\alpha + \alpha', \beta_1 + \beta_1', \beta_2 + \beta_2' + \beta_1 \frac{\alpha'}{1!},
\beta_3 + \beta_3' + \beta_1 \frac{\alpha'}{2!} + \beta_1 \frac{\alpha'^2}{2!}, \ldots).
\]

The group \( G_n \) is a nilpotent, affine, algebraic group over \( \mathbb{C}_p \). The nilpotence class of \( G_n \) is \( n \), \( G_n^{ab} = \mathbb{C}_p \oplus \mathbb{C}_p \) and, for each \( k \leq n \), \( \Gamma^k G_n / \Gamma^{k+1} G_n \approx \mathbb{C}_p \) is generated by the class of some \( \theta(0, \ldots, 0, \beta_k, \ldots) \) with \( \beta_k \neq 0 \), \( \alpha = 0 \) and \( \beta_i = 0 \) for \( i < k \). Observe that

\[
\text{Gal}_\delta(F/C_p(z - a)(\Psi, T_1, \ldots, T_k)) \approx \Gamma^{k+1} G_n.
\]

Let \( f_1(z), \ldots, f_m(z) \) be rational functions on \( P^1(\mathbb{C}_p) \). We consider the following system of differential equations

\[
\begin{cases}
T' = 0, & \Psi_i' = T \cdot \frac{f_i'}{f_i}, \\
T_{1,i}' = T \cdot \frac{f_i'}{1 - f_i}, & T_{k,i}' = T_{k-1,i} \cdot \frac{f_i'}{f_i}
\end{cases}
\]

for \( k = 2, \ldots, n \), \( i = 1, \ldots, m \) with initial conditions

\[
T = 1, \quad \Psi_i(a) = 0 \quad \text{and} \quad T_{k,i}(a) = 0.
\]

Let \( G \) be a differential Galois group of the system (***). Let

\[
F_s = C_p(z - a)(\Psi_i, T_{k,i})_{i=1,\ldots,m, \quad k=1,\ldots,s}.
\]

Then \( \text{Gal}_\delta(F_n/C_p(z - a)) = G \) and \( \text{Gal}_\delta(F_n/F_s) \approx \Gamma^{s+1} G \).

**THEOREM 5.1.** — There is a functional equation

\[
(****) \quad \sum_{i=1}^m n_i T_{n,i}(z) + p(z) = 0
\]

where \( p(z) \in F_{n-1} \) and \( \sum_{i=1}^m |n_i| > 0 \) if and only if \( \dim \Gamma^n G < m \).
Proof. — The differential Galois group $G$ is given by the following automorphisms of the field $F_n$:

$$\Psi_i \mapsto \Psi_i + \alpha_i$$

$$\theta((\alpha_i)_{i=1,\ldots,n}, (\beta_{k,i})_{i=1,\ldots,n})_{k=1,\ldots,m} :$$

$$T_{k,i} \mapsto T_{k,i} + \sum_{\ell=1}^{k} \frac{\beta_{\ell,i}}{(k-\ell)!} \Psi_i^{k-\ell}.$$

The parameters $\alpha_i$, $\beta_{k,i}$ need not be longer independent hence we have $\dim G \leq m(n+1)$. We shall denote by $\theta(\beta_{k,0})$ the element $\theta$ of $\text{Aut}_{\partial}(F_n/C_p(z-a))$ such that all $\alpha_i = 0$ and all $\beta_{k,i} = 0$ but $\beta_{k,0} \neq 0$.

Let us assume that we have a functional equation (****). Applying $\theta(\beta_{n,1}) \circ \theta(\beta_{n,2}) \circ \cdots \circ \theta(\beta_{n,m})$ to (****), we get

$$\sum_{i=1}^{n} n_i(T_{n,i}(z) + \beta_{n,i}) + p(z) = 0.$$

Hence $\sum_{i=1}^{n} n_i \beta_{n,i} = 0$. Observe that the group $\Gamma^n G$ is generated by elements $\theta(\beta_{n,i})$ for $i = 1,\ldots,m$. This implies that $\dim \Gamma^n G g < m$.

The group $\Gamma^n G$ is an abelian group, quotient of $C_p^m$, generated by the elements $\theta(\beta_{n,i})$ for $i = 1,\ldots,m$. Hence every element $\theta \in \Gamma^n G$ has the form

$$\theta(\beta_{n,1}) \circ \theta(\beta_{n,2}) \circ \cdots \circ \theta(\beta_{n,m}).$$

Let us assume that $\dim \Gamma^n G < m$. Then there is a non-trivial relation $\sum_{i=1}^{n} n_i \beta_{n,i} = 0$ for any $\theta = \theta(\beta_{n,1}) \circ \theta(\beta_{n,2}) \circ \cdots \circ \theta(\beta_{n,m}) \in \Gamma^n G$.

Observe that the function $\sum_{i=1}^{m} n_i T_{n,i}(z)$ is fixed by $\Gamma^n G$, because

$$\theta : \sum_{i=1}^{m} n_i T_{n,i}(z) \mapsto \sum_{i=1}^{m} n_i (T_{n,i}(z) + \beta_{n,i}) = \sum_{i=1}^{m} n_i T_{n,i}(z) + \sum_{i=1}^{m} n_i \beta_{n,i}.$$

The isomorphism $\text{Aut}_{\partial}(F_n/F_{n-1}) \approx \Gamma^n G$ implies that

$$\sum_{i=1}^{m} n_i T_{n,i}(z) \in F_{n-1}.$$
Remark. — Solutions of (**) are

\[ T_0 = 1, \quad \Psi(z) = \int_a^z \frac{dz}{z}, \quad T_k(z) = \int_a^z \frac{dz}{1-z}, \frac{dz}{z}, \ldots, \frac{dz}{z} \]

and solutions of (***) are

\[ T = 1, \quad \Psi_i(z) = \int_{f_i(a)}^{f_i(z)} \frac{dz}{z}, \quad T_{k,i}(z) = \int_{f_i(a)}^{f_i(z)} \frac{dz}{1-z}, \frac{dz}{z}, \ldots, \frac{dz}{z} \]
