# ON FINITELY GENERATED CLOSED IDEALS IN $\mathbf{H}^{\infty}$ (D) 

## by Jean BOURGAIN

## 1. Introduction.

Let $H^{\infty}=H^{\infty}(D)$ be the Banach algebra of bounded analytic functions on the open disc $D=\{z \in \mathbf{C} ;|z|<1\}$, endowed with the sup norm $\|f\|=\sup _{z \in \mathrm{D}}|f(z)|$. The result presented in this paper may as well be formulated for $\mathrm{H}^{\infty}$ on the upper half plane $\mathbf{R}_{+}^{2}=\{x+i y ; x \in \mathbf{R}$, $\left.y \in \mathbf{R}_{+}\right\}$.

If $f_{1}, \ldots, f_{\mathrm{N}}$ is a finite sequence in $\mathrm{H}^{\infty}$, we denote $\mathrm{I}\left(f_{1}, \ldots, f_{\mathrm{N}}\right)$ the ideal generated by $\left\{f_{1}, \ldots, f_{\mathrm{N}}\right\}$, thus

$$
\mathrm{I}\left(f_{1}, \ldots, f_{\mathrm{N}}\right\}=\left\{\sum_{1 \leqslant j \leqslant \mathrm{~N}} f_{j} g_{j} ; g_{j} \in \mathrm{H}^{\infty}\right\}
$$

The solution to the corona problem for $\mathrm{H}^{\infty}(\mathrm{D})$ (see [1], [4]) states that the 1 -function 1 belongs to $\mathrm{I}\left(f_{1}, \ldots, f_{\mathrm{N}}\right)$ if

$$
\inf _{z \in \mathrm{D}} \max _{1 \leqslant j \leqslant \mathrm{~N}}\left|f_{j}(z)\right|>0 .
$$

There are by now several methods to prove this result. The reader may consult [4] for a systematic exposition. The simple approach due to T . Wolff permits to obtain certain extensions. For instance, if $\left\{f_{j}\right\}_{1 \leqslant j \leqslant N}$ and $f$ in $\mathbf{H}^{\infty}$ satisfy

$$
\begin{equation*}
|f(z)| \leqslant C \max _{1 \leqslant j \leqslant N}\left|f_{j}(z)\right| \tag{1}
\end{equation*}
$$

for all $z \in \mathrm{D}$ and a constant C , then $f^{3}$ belongs to $\mathrm{I}\left(f_{1}, \ldots, f_{\mathrm{N}}\right)$. An

[^0]example of Rao, which we improve here, shows that (1) does not necessarily implies $f \in \mathrm{I}\left(f_{1}, \ldots, f_{\mathrm{N}}\right)$ while for $f^{2}$ the question seems unsolved at the time of this writing (see again [4] for details).

In the spirit of Rao's example, consider Blaschke product $B_{1}, B_{2}$ with disjoint zero sets such that however

$$
\begin{equation*}
\inf _{z \in \mathrm{~B}}\left(\left|\mathrm{~B}_{1}(z)\right|+\left|\mathbf{B}_{2}(z)\right|\right)=0 \tag{2}
\end{equation*}
$$

Fix an integer $r \geqslant 2$ and let $f_{1}=\mathrm{B}_{1}^{r}, f_{2}=\mathrm{B}_{2}^{r}$ and $f=\mathrm{B}_{1}^{r-1} \mathrm{~B}_{2}^{r-1}$. Then

$$
|f(z)| \leqslant \alpha\left(\left|f_{1}(z)\right|+\left|f_{2}(z)\right|\right) \text { for } z \in \mathbf{B}, \quad \text { defining } \alpha(t)=t^{2\left(1-\frac{1}{r}\right)}
$$

We claim that $f$ does not belong to $\mathrm{I}\left(f_{1}, f_{2}\right)$. Otherwise indeed, one should have

$$
\left(\mathrm{B}_{1} \mathrm{~B}_{2}\right)^{r-1}=g_{1} \mathrm{~B}_{1}^{r}+g_{2} \mathrm{~B}_{2}^{r} ; \quad g_{1}, g_{2} \in \mathrm{H}^{\infty}
$$

hence, since $B_{1}$ and $B_{2}$ do not have common zero's

$$
g_{1}=h_{1} \mathrm{~B}_{2}^{r-1}, \quad g_{2}=h_{2} \mathrm{~B}_{1}^{r-1} ; \quad h_{1}, h_{2} \in \mathrm{H}^{\infty}
$$

which is contradicted by (2).
Our purpose is to prove following property, implying in particular that in previous example $f$ is in the closure of $\mathrm{I}\left(f_{1}, f_{2}\right)$ for $r \geqslant 3$ (actually already for $r=2$ if we assume that the zero-set of either $B_{1}$ or $B_{2}$ forms an interpolating sequence).

Theorem. - Let $\left\{f_{j}\right\}_{1 \leqslant j \leqslant \mathrm{~N}}$ and $f$ be $\mathrm{H}^{\infty}(\mathrm{D})$-functions. Assume the existence of a function $\alpha$ on $\mathbf{R}_{+}, \lim _{t \rightarrow 0} \frac{\alpha(t)}{t}=0$ such that

$$
\begin{equation*}
|f(z)| \leqslant \alpha\left(\left|f_{1}(z)\right|+\cdots \cdot\left|f_{\mathrm{N}}(z)\right|\right) \quad \text { for } \quad z \in \mathrm{D} \tag{3}
\end{equation*}
$$

Then $f$ belongs to the norm closure of the ideal $\mathrm{I}\left(f_{1}, \ldots, f_{\mathrm{N}}\right)$.
Notice that the construction described above gives an example of a nonclosed ideal $\mathrm{I}\left(f_{1}, f_{2}\right)$.

It will be improved later in order to show that condition (3) taking $\alpha(t)=$ C. $t$ does not imply the conclusion of the theorem. This second example will require some new ideas, such as the use of the Douglas-Rudin approximation result.

Recall that a positive measure $\mu$ on $D$ is a Carleson-measure provided there is a constant C satisfying

$$
\begin{equation*}
\mu(\mathrm{R}(\mathrm{I})) \leqslant \mathrm{C}|\mathrm{I}| \tag{4}
\end{equation*}
$$

whenever $I$ is an interval in $\Pi=\partial \mathrm{D}=\{z \in \mathbf{C} ;|z|=1\}$, denoting $|\mathrm{I}|$ the length of $I$ and $R(I)$ the region

$$
\left\{z \in \mathrm{D} ; \frac{z}{|z|} \in \mathrm{I} \text { and }|z| \geqslant 1-|\mathrm{I}|\right\} .
$$

Let $\|\mu\|_{C}$ stand for the smallest constant verifying (4).
Carleson measures will be exploited here in connection with following result due to $L$. Carleson on existence of bounded solution to the $\bar{\delta}$ equation.

Proposition 1. - If $\mu$ is a Carleson-measure on D , then the equation

$$
\bar{\partial} \mathrm{F}=\mu, \quad \bar{\partial}=\partial / \partial x+i(\partial / \partial y)
$$

has a solution on D satisfying $\|\mathrm{F}\|_{\mathrm{L}^{\infty}(\mathrm{I})} \leqslant \mathrm{C}_{1}\|\mu\|_{\mathrm{C}}$, where $\mathrm{C}_{1}$ is numerical.
Of course, in proving the theorem, we will make use of the Koszulcomplex and $\bar{\partial}$-correction. The following two facts explain how Carleson measures may arise.

The first is due to J. Garnett [4] (in a weaker form) and B. Dahlberg [3]. The second, I think, is new and improves on the «contour» construction in Carleson original solution to the corona-problem.

Proposition 2. - Let $u$ be a 1-bounded harmonic function on D. For each $\varepsilon>0$, there exists $a \mathscr{C}^{\infty}$-function $v=v_{\varepsilon}$ on D satisfying

$$
\begin{equation*}
|v-u|<\varepsilon \quad \text { on } \mathrm{D} \tag{5}
\end{equation*}
$$

$$
\begin{equation*}
\||\nabla u| d x d y\|_{\mathrm{C}}<\frac{\mathrm{C}_{2}}{\varepsilon} \tag{6}
\end{equation*}
$$

Proposition 3. - Assume B a Blaschke product on D. Given $\varepsilon>0$, there exists an open set R in D such that $\partial \mathrm{R}$ is a rectifiable curve and

$$
\begin{gathered}
|\mathrm{B}(z)|<\varepsilon \quad \text { if } \quad z \in \mathrm{R} \\
|\mathrm{~B}(z)|>\delta(\varepsilon) \quad \text { if } \quad z \in \mathrm{D} \backslash \mathrm{R} \\
\left\|\lambda_{\partial \mathrm{R}}\right\|_{\mathrm{C}}<\mathrm{C}_{3}
\end{gathered}
$$

where $\delta(\varepsilon)$ is a fixed function of $\varepsilon$ (independent of B$)$ and $\lambda_{\partial \mathrm{R}}$ refers to the arc-length-measure of the boundary of R .

This result should be compared with [4], p. 342. The new feature is the estimate on $\left\|\lambda_{\partial \mathrm{R}}\right\|_{\mathrm{C}}$ independent of $\varepsilon$.

In the next section, the theorem will be deduced from Props. 1, 2 and 3. In section 3 we elaborate the example which was announced earlier. Section 4 of the paper is devoted to the proof of Prop. 3.

The author is indebted to T. Wolff and J. Garnett for some valuable discussions.

## 2. Proof of the theorem.

Assume $\left\{f_{j}\right\}_{j=1}^{\mathrm{N}}$ and $f$ in $\mathrm{H}^{\infty}$ satisfying $|f(z)| \leqslant \alpha\left(\sum_{1 \leqslant j \leqslant \mathrm{~N}}\left|f_{j}(z)\right|\right)$ for $z \in \mathrm{D}$, where $\alpha: \mathbf{R}_{+} \rightarrow \mathbf{R}_{+}$fulfils $\lim _{t \rightarrow 0} \frac{\alpha(t)}{t}=0$. To be more explicit, we give the argument for $\mathbf{N}=2$, the general case being completely analogue. We use the letter $\mathbf{C}$ to denote numerical constants. It follows from our hypothesis that in particular

$$
|f(z)| \leqslant C\left(\left|f_{1}(z)\right|+\left|f_{2}(z)\right|\right), \quad z \in \mathrm{D}
$$

for some constant C . Without restriction, we may take $\|f\|_{\infty},\left\|f_{1}\right\|_{\infty}$ and $\left\|f_{2}\right\|_{\infty}<1$.

Writing $f \in \mathbf{H}^{\infty}$ as product $f=$ B.F where B is a Blaschke product and $F$ a zero-free function on $D(|F| \leqslant 1)$, the approximation argument given in [2] (p. 204, Lemma 3) permits to formulate Prop. 3 for functions in the unit-ball of $\mathbf{H}^{\infty}$ as well.

Fix $\varepsilon>0$ and apply Prop. 3 to our function $f$, providing the region $\mathbf{R}$ with boundary $\Gamma=\partial \mathbf{R}$ satisfying the estimate on arc-length.

Let $\tau>0$ to be defined later and apply Prop. 2 to each of the functions $f_{1}, f_{2}$, giving $\mathrm{C}^{\infty}$-functions $v_{1}, v_{2}$ on D such that
(7) $\left|f_{1}(z)-v_{1}(z)\right|<\tau, \quad\left|f_{2}(z)-v_{2}(z)\right|<\tau, \quad(z \in D)$
(8) $\left\|\left|\nabla v_{1}\right| d x d y\right\|_{\mathrm{C}}<\mathrm{C} \tau^{-1} ; \quad\left\|\left|\nabla v_{2}\right| d x d y\right\|_{\mathrm{C}}<\mathrm{C} \tau^{-1}$.

If we define for $j=1,2$

$$
g_{j}=\bar{v}_{j}\left(f_{1} \bar{v}_{1}+f_{2} \bar{v}_{2}\right)^{-1} \chi_{\mathrm{D} \backslash \mathrm{R}}
$$

then
(9) $1-\left(g_{1} f_{1}+g_{2} f_{2}\right)=\chi_{\mathrm{R}}$ hence $f_{1} \bar{\partial} g_{1}+f_{2} \bar{\partial} g_{2}=-\bar{\partial} \chi_{\mathrm{R}}$.

Consider solutions $a_{12}, a_{21}$ and $b_{1}, b_{2}$ of the respective $\bar{\delta}$-equations

$$
\left\{\begin{array}{l}
\bar{\partial} a_{12}=f g_{1} \bar{\partial} g_{2}  \tag{10}\\
\bar{\partial} a_{21}=f g_{2} \bar{\partial} g_{1}
\end{array}\right.
$$

and

$$
\begin{equation*}
\bar{\partial} b_{j}=f \bar{v}_{j}\left(f_{1} \bar{v}_{1}+f_{2} \bar{v}_{2}\right)^{-1} \bar{\partial} \chi_{\mathrm{R}} \quad(j=1,2) \tag{11}
\end{equation*}
$$

with $\mathrm{L}^{\infty}$-norm control on $\partial \mathrm{D}$. This will be realized with Prop. 1. Postponing the estimations on Carleson-norm, put

$$
\left\{\begin{array}{l}
h_{1}=f g_{1}+\left(a_{12}-a_{21}\right) f_{2}+b_{1}  \tag{12}\\
h_{2}=f g_{2}+\left(a_{21}-a_{12}\right) f_{1}+b_{2}
\end{array}\right.
$$

By construction and (9)

$$
f-\left(h_{1} f_{1}+h_{2} f_{2}\right)=f \chi_{\mathrm{R}}-b_{1} f_{1}-b_{2} f_{2}
$$

(13) $\left\|f-\left(h_{1} f_{1}+h_{2} f_{2}\right)\right\|_{L^{\infty}(\mathrm{I})} \leqslant \varepsilon+\left\|b_{1}\right\|_{L^{\infty}(\Pi)}+\left\|b_{2}\right\|_{L^{\infty}(\Pi)}$.

Next, we verify that $h_{j}(j=1,2)$ are analytic. From (13) will then follow an estimation on $\left\|f-\left(h_{1} f_{1}+h_{2} f_{2}\right)\right\|_{L^{\infty}(\mathrm{D})}$. Consider $h_{1}$ for instance. By (9), (10), (11)

$$
\begin{aligned}
\bar{\partial} h_{1} & =f \bar{\partial} g_{1}+f\left(g_{1} \bar{\partial} g_{2}-g_{2} \bar{\partial} g_{1}\right) f_{2}+\bar{\partial} b_{1} \\
& =f\left(1-g_{2} f_{2}\right) \bar{\partial} g_{1}-f g_{1}\left(f_{1} \bar{\partial} g_{1}+\bar{\partial} \chi_{\mathrm{R}}\right)+\bar{\partial} b_{1} \\
& =-f \bar{v}_{1}\left(f_{1} \bar{v}_{1}+f_{2} \bar{v}_{2}\right)^{-1} \bar{\partial} \chi_{\mathrm{R}}+\bar{\partial} b_{1}=0 .
\end{aligned}
$$

We now turn our attention to eqs. (10), (11). Choose $\tau<\frac{1}{10} \delta(\varepsilon)^{2}$ where $\delta(\varepsilon)$ refers to Prop. 3. Since by (7)

$$
\left|f g_{j}\right| \leqslant \mathrm{C}\left(\left|f_{1}\right|+\left|f_{2}\right|\right)\left(\left|f_{j}\right|+\tau\right)\left(\left|f_{1}\right|^{2}+\left|f_{2}\right|^{2}-2 \tau\right)^{-1} \chi_{\mathrm{D} \backslash \mathrm{R}}
$$

and

$$
\delta(\varepsilon) \leqslant|f| \leqslant \mathrm{C}\left(\left|f_{1}\right|+\left|f_{2}\right|\right) \quad \text { outside the region } \mathrm{R}
$$

it follows thus

$$
\begin{equation*}
\left\|f g_{j}\right\|_{\mathrm{L}^{\infty}(\mathrm{D})} \leqslant \mathrm{C}, \quad(j=1,2) \tag{14}
\end{equation*}
$$

We have, letting $\partial=\partial / \partial x-i(\partial / \partial y)$

$$
\begin{aligned}
& \partial g_{j}=\overline{\partial v_{j}}\left(f_{1} \bar{v}_{1}+f_{2} \bar{v}_{2}\right)^{-1} \chi_{\mathrm{D} \backslash \mathrm{R}}+\bar{v}_{j}\left(f_{1} \bar{v}_{1}+f_{2} \bar{v}_{2}\right)^{-2}\left(f_{1} \overline{\partial v_{1}}+f_{2} \overline{\partial v_{2}}\right) \chi_{\mathrm{D} \backslash \mathrm{R}} \\
&-\bar{v}_{j}\left(f_{1} \bar{v}_{1}+f_{2} \bar{v}_{2}\right)^{-1} \bar{\partial} \chi_{\mathrm{R}}
\end{aligned}
$$

implying by (14) for $j=1,2$

$$
\left\|f g_{j} \bar{\partial} g_{3-j}\right\|_{\mathrm{C}} \leqslant \delta^{-2}\left\|\left\{\left|\nabla v_{1}\right|+\left|\nabla v_{2}\right|\right\} d x d y\right\|_{\mathrm{C}}+\delta^{-1}\left\|\lambda_{\Gamma}\right\|_{\mathrm{C}}
$$

From (8) and Prop. 1, we may conclude the existence of solutions $a_{12}, a_{21}$ to (10) satisfying

$$
\begin{equation*}
\left\|a_{j, 3-j}\right\|_{L^{\infty}(\partial \mathrm{D})} \leqslant \mathrm{C} \tau^{-1} \delta^{-2} \tag{15}
\end{equation*}
$$

Remains to analyze the right members in eqs. (11). Since $\bar{\partial} \chi_{R}$ is supported by $\Gamma$ and on $\Gamma$

$$
\begin{aligned}
f \bar{v}_{j}\left(f_{1} \bar{v}_{1}+f_{2} \bar{v}_{2}\right)^{-1} & \leqslant 2\left\{\varepsilon \wedge \alpha\left(\left|f_{1}\right|+\left|f_{2}\right|\right)\right\}\left(\left|f_{j}\right|+\tau\right)\left(\left|f_{1}\right|^{2}+\left|f_{2}\right|^{2}\right)^{-1} \\
& <2 \sup \left\{\frac{\alpha(t)}{t} \wedge \varepsilon\right\}+\mathrm{C} \tau
\end{aligned}
$$

the hypothesis $\lim _{t \rightarrow 0} \frac{\alpha(t)}{t}=0$ and numerical estimate $\left\|\lambda_{r}\right\|_{c} \leqslant$ const., imply

$$
\left\|f v_{j}\left(f_{1} \bar{v}_{1}+f_{2} \bar{v}_{2}\right)^{-1} \bar{\partial} \chi_{\mathrm{R}}\right\|_{\mathrm{C}} \rightarrow 0 \quad \text { taking } \quad \varepsilon \rightarrow 0
$$

Again by Prop. 1, this allows us to obtain $b_{j}$ satisfying (11) and $\left\|b_{j}\right\|_{L^{\infty}(\partial \mathrm{D})}$ as small as desired. In particular, we proved, see (14), (15),

$$
h_{j} \in \mathrm{H}^{\infty}(\mathrm{D}) ; \quad\left\|h_{j}\right\|_{\infty}<\mathrm{C} \delta(\varepsilon)^{-4}, \quad(j=1,2)
$$

As a consequence of (13), $\left\|f-h_{1} f_{1}-h_{2} f_{2}\right\|_{\infty}$ can be made arbitrarily small. Hence $\operatorname{dist}_{\mathbf{H}^{\infty}}\left(f, \mathrm{I}\left(f_{1}, f_{2}\right)\right)=0$, completing the proof.

Remark. - Estimations appearing above are not best possible. We did not attempt to do so in order to avoid unnecessary complications.

## 3. An example.

The purpose of this section is to improve Rao's example of Blaschke products $B_{1}, B_{2}$ on $D$ such that $B_{1} \cdot B_{2}$ does not belong to the ideal
$\mathrm{I}\left(\mathrm{B}_{1}^{2}, \mathrm{~B}_{2}^{2}\right)$. In this construction, $f=\mathrm{B}_{1} . \mathrm{B}_{2}$ will not be in the uniform closure of $\mathrm{I}\left(\mathrm{B}_{1}^{2}, \mathrm{~B}_{2}^{2}\right)$. The argument is particularly simple. Let us recall the classical Douglas-Rudin theorem asserting that any unimodular function $\sigma,|\sigma|=1$, on $\Pi$ can be uniformly approximated by a quotient of Blaschke products [4], thus there are Blaschke products $B_{1}$, $B_{2}$ s.t.

$$
\begin{equation*}
\left|\sigma(\theta)-\mathrm{B}_{1}^{\varepsilon}\left(e^{i \theta}\right) \overline{\mathrm{B}_{2}^{\varepsilon}\left(e^{i \theta}\right)}\right|<\varepsilon . \tag{16}
\end{equation*}
$$

Apply this property to the function $\sigma(\theta)=\operatorname{sign} \sin \theta$. Assume $g_{1}$, $g_{2} \in \mathbf{H}^{\infty}(\mathrm{D})$ such that for some $\gamma>0$

$$
\begin{equation*}
\left|\mathbf{B}_{1} \mathrm{~B}_{2}-g_{1} \mathrm{~B}_{1}^{2}-g_{2} \mathbf{B}_{2}^{2}\right|<1-\gamma \tag{17}
\end{equation*}
$$

assuming $\varepsilon \ll \gamma$. Let for $0<r<1$ the conjugate Poisson kernel $2 r \sin \theta\left[1-2 r \cos \theta+r^{2}\right]^{-1}$ be denoted by $\mathrm{Q}_{r}(\theta)$. Recall that if $g \in \mathrm{H}^{\infty}$, then

$$
\frac{1}{2 \pi} \int_{0}^{2 \pi} g\left(e^{i \theta}\right) \mathrm{Q}_{r}(\theta) d \theta=(\mathscr{H} g)(r)=-i[g(r)-g(0)]
$$

hence

$$
\left|\int_{\Pi} g \cdot Q_{r}\right|<2\|g\|_{\infty}
$$

Restricting (17) to $\Pi$ implies by (16)

$$
\left|\sigma-g_{1}-g_{2}\right|<1-\gamma+\varepsilon+2\left\|g_{1}\right\|_{\infty} \varepsilon .
$$

Therefore, clearly

$$
\left\|Q_{r}\right\|_{1}=\left|\int_{\Pi} Q_{r} \sigma\right| \leqslant\left(1-\gamma+\varepsilon+2\left\|g_{1}\right\|_{\infty} \varepsilon\right)\left\|Q_{r}\right\|_{1}+2\left(\left\|g_{1}\right\|_{\infty}+\left\|g_{2}\right\|_{\infty}\right)
$$

and consequently

$$
\left\|g_{1}\right\|_{\infty}+\left\|g_{2}\right\|_{\infty} \geqslant \frac{\gamma}{10} \min \left\{\varepsilon^{-1}, \log (1-r)^{-1}\right\}
$$

Letting $r \underset{<}{\rightarrow} 1$, this implies the lower bound ${ }^{\circ}$

$$
\left\|g_{1}\right\|_{\infty}+\left\|g_{2}\right\|_{\infty} \geqslant \frac{\gamma}{10 \varepsilon}
$$

on any pair of $\mathbf{H}^{\infty}$-functions satisfying (17).

From this observation and a compactness-argument, whose details are left to the reader, one can produce a pair $B_{1}, B_{2}$ of Blaschke products such that $\underset{H^{\infty}}{\operatorname{dist}}\left(B_{1} B_{2}, I\left(B_{1}^{2}, B_{2}^{2}\right)\right)=1$, In fact, the proof of the DouglasRudin theorem given by P. Jones (see [4], p. 428) permits to construct $B_{1}, B_{2}$ satisfying

$$
\lim _{|\theta| \rightarrow 0}\left|\mathbf{B}_{1}\left(e^{i \theta}\right) \overline{\mathbf{B}_{2}\left(e^{i \theta}\right)}-\operatorname{sign} \sin \theta\right|=0
$$

which will have the desired property as a consequence of previous reasoning.

## 4. Proof of proposition 3.

The argument does not require preliminaries from potential theory, such as harmonic measures and Hall's lemma. Define $\rho(a, b)=\left|\frac{a-b}{1-\bar{a} b}\right|$ for $a, b \in \mathrm{D}$, i.e. the pseudo-hyperbolic distance. Following lemma is wellknown.

Lemma 1. - Let $\mathrm{B}(z)=\Pi \frac{z-a_{n}}{1-\bar{a}_{n} z}$ be a (finite) Blaschke product and $\varepsilon>0$. Then

$$
\frac{1}{2} \Sigma \frac{\left(1-|z|^{2}\right)\left(1-\left|a_{n}\right|^{2}\right)}{\left|1-\bar{a}_{n} z\right|^{2}} \leqslant-\log |\mathrm{B}(z)| \leqslant 2 \log \frac{1}{\varepsilon} \Sigma \frac{\left(1-|z|^{2}\right)\left(1-\left|a_{n}\right|^{2}\right)}{\left|1-\bar{a}_{n} z\right|^{2}}
$$

provided $\inf _{n} \rho\left(z, a_{n}\right)>\varepsilon$.

$$
\begin{gathered}
\text { Proof. }-\left|\frac{z-a_{n}}{1-\bar{a}_{n} z}\right|^{2}=1-\frac{\left(1-|z|^{2}\right)\left(1-\left|a_{n}\right|^{2}\right)}{\left|1-\bar{a}_{n} z\right|^{2}} \text { and } \\
t \leqslant-\log (1-t) \leqslant 2\left(\log \frac{1}{\varepsilon}\right) t \text { if } \quad 0 \leqslant t \leqslant 1-\varepsilon
\end{gathered}
$$

If $I$ is an interval in $\Pi$, denote $I$ the interval with same midpoint as $I$ and $|\tilde{I}|=2|I|$.

Lemme 2. - Let $a \in \mathrm{D}$ and $|\mathrm{B}(a)|>\varepsilon>0$. Let I be an interval in $\Pi$ such that $\frac{1}{2}|\mathrm{I}|<1-|a|<|\mathrm{I}|$ and $\frac{a}{|a|} \in \mathrm{I}$, i.e. a belongs to the upperhalf of $\mathrm{R}(\mathrm{I})$.

Given $\mathrm{M}<\infty$ there exists a collection $\left\{\mathrm{I}_{k}\right\}$ of disjoint subintervals of $\mathbb{I}$ satisfying

$$
\begin{gather*}
\Sigma\left|\mathrm{I}_{k}\right| \leqslant \mathrm{C}_{4}\left(\log \frac{1}{\varepsilon}\right) \mathrm{M}^{-1}|\mathrm{I}| .  \tag{18}\\
\text { If } \quad z \in \mathrm{R}(\mathrm{I}) \backslash \bigcup \mathrm{R}\left(\mathrm{I}_{k}\right) \quad \text { and } \quad \inf _{n} \rho\left(z, a_{n}\right)>\gamma, \tag{19}
\end{gather*}
$$

then

$$
\log |\mathrm{B}(z)|^{-1} \leqslant \mathrm{C}_{4}\left(\log \frac{1}{\gamma}\right)\left(\mathrm{M}+\log \frac{1}{\varepsilon}\right)
$$

Proof. - Let $\left\{\mathrm{I}_{k}\right\}$ be the collection of maximal subintervals of $\mathbb{I}$, obtained by diadic splitting of $\mathbb{I}$, satisfying

$$
\sum_{a_{n} \in \mathrm{R}\left(\mathrm{I}_{k}\right)}\left(1-\left|a_{n}\right|\right)>\mathrm{M}\left|\mathrm{I}_{k}\right| .
$$

By lemma 1

$$
\mathrm{M} \Sigma\left|\mathrm{I}_{k}\right| \leqslant \sum_{a_{n} \in \mathrm{R}(\mathrm{I})}\left(1-\left|a_{n}\right|\right) \leqslant \mathrm{C}|I| \Sigma \frac{\left(1-|a|^{2}\right)\left(1-\left|a_{n}\right|^{2}\right)}{\left|1-\bar{a} \cdot a_{n}\right|^{2}} \leqslant \mathrm{C}|\mathrm{I}| \log \frac{1}{|\mathrm{~B}(a)|}
$$

implying (18).
Let now $z \in \mathbf{R}(\mathrm{I}) \backslash \bigcup \mathbf{R}\left(\mathrm{I}_{k}\right)$. Let $\left\{\mathrm{J}_{s}\right\}_{1 \leqslant s \leqslant t}$ be the increasing sequence of diadic subintervals of I containing $z$, where

$$
1-|z|<\left|\mathrm{J}_{1}\right|<2(1-|z|) \quad \text { and } \quad \mathrm{J}_{t}=\tilde{\mathrm{I}}
$$

By construction, for $s=1, \ldots, t$

$$
\sum_{a_{n} \in \mathrm{R}\left(\mathrm{~J}_{s}\right)}\left(1-\left|a_{n}\right|\right)<\mathrm{M}\left|\mathrm{~J}_{s}\right|
$$

and hence, as easily verified

$$
\text { (20) } \begin{aligned}
\sum_{a_{n} \in \mathrm{R}(\mathrm{I})} \frac{\left(1-|z|^{2}\right)\left(1-\left|a_{n}\right|^{2}\right)}{\left|1-\bar{a}_{n} z\right|^{2}} & \leqslant \sum_{a_{n} \in \mathrm{R}\left(\mathrm{~J}_{2}\right)}+\sum_{s=2}^{t} \sum_{a_{n} \in \mathrm{R}\left(\mathrm{~J}_{s+1}\right) \backslash \mathrm{R}\left(\mathrm{~J}_{s}\right)} \\
& \leqslant \mathrm{CM}+\sum_{s=2}^{t} \mathrm{CM} 2^{-s}=\mathrm{CM} .
\end{aligned}
$$

If $a_{n} \notin \mathrm{R}(\mathbb{1})$, then clearly

$$
\frac{\left(1-|z|^{2}\right)\left(1-\left|a_{n}\right|^{2}\right)}{\left|1-\bar{a}_{n} z\right|^{2}} \leqslant \mathrm{C} \frac{\left(1-|a|^{2}\right)\left(1-\left|a_{n}\right|^{2}\right)}{\left|1-\bar{a}_{n} z\right|^{2}}
$$

and so, by lemma 1 and hypothesis

$$
\begin{equation*}
\sum_{a_{n} \& \mathrm{R}(\mathbb{I})} \frac{\left(1-|z|^{2}\right)\left(1-\left|a_{n}\right|^{2}\right)}{\left|1-\bar{a}_{n} z\right|^{2}} \leqslant \mathrm{C} \log \frac{1}{\varepsilon} . \tag{21}
\end{equation*}
$$

Adding (20), (21) and using again Lemma 1 gives (19).

Lemma 3. - In the situation of Lemma 2 and given $\gamma>0$, there is a set $\mathrm{O}(\mathrm{I})$ in $\mathrm{R}(\mathrm{I})$ with rectifiable boundary $\Gamma(\mathrm{I})$ such that

$$
\begin{align*}
& \left\|\lambda_{\Gamma(\mathrm{I})}\right\|_{\mathrm{C}} \leqslant \mathrm{C}_{5} \gamma\left[\mathrm{M}+\log \frac{1}{\varepsilon}\right]  \tag{22}\\
& |\mathrm{B}(z)|<\gamma \quad \text { if } \quad z \in \mathrm{O}(\mathrm{I}) \tag{23}
\end{align*}
$$

$$
\begin{equation*}
|\mathrm{B}(z)|>\exp \left(-\mathrm{C}_{5}\left(\log \frac{1}{\gamma}\right)\left(\mathrm{M}+\log \frac{1}{\varepsilon}\right)\right) \tag{24}
\end{equation*}
$$

if

$$
z \in \mathbf{R}(\mathrm{I}) \backslash\left\{\mathbf{O}(\mathrm{I}) \cup \bigcup \mathbf{R}\left(\mathrm{I}_{k}\right)\right\} .
$$

Proof. - Define $\mathrm{O}(\mathrm{I})=\left[\mathrm{R}(\mathrm{I}) \backslash \bigcup \mathrm{R}\left(\mathrm{I}_{k}\right)\right] \cap \bigcup_{a_{n} \in \mathrm{R}(\mathrm{I})}\left[\rho\left(z, a_{n}\right) \leqslant \gamma\right]$. Then (23) is trivial and (24) follows from (19). Also, again
(25) $\quad|\Gamma| \leqslant \mathrm{C} \gamma \sum_{a_{n} \in \mathrm{R}(\mathbb{I})}\left(1-\left|a_{n}\right|\right) \leqslant \mathrm{C} \gamma|\mathrm{I}| \Sigma \frac{\left(1-|a|^{2}\right)\left(1-\left|\mathrm{a}_{n}\right|^{2}\right)}{\mid 1-\bar{a}_{n} a^{2}}$

$$
\leqslant \mathrm{C} \gamma\left(\log \frac{1}{\varepsilon}\right)|\mathrm{I}|
$$

Suppose now $J$ is a diadic subinterval of $I$ contained in $I$. If $J$ is contained in $\bigcup I_{k}$, then $\Gamma \cap \mathrm{R}(\mathrm{J})=\varnothing$. Otherwise, by construction of the $I_{k}$-intervals

$$
\sum_{a_{n} \in \mathrm{R}(\boldsymbol{J})}\left(1-\left|a_{n}\right|\right) \leqslant 2 \mathrm{M}|\mathrm{~J}| .
$$

Therefore

$$
\begin{align*}
|\Gamma \cap \mathbf{R}(\mathbf{J})| \leqslant \sum_{\left[\rho\left(z, a_{n}\right) \leqslant \gamma\right] \cap \mathbf{R}(\mathrm{J}) \neq \varnothing} \mathrm{C}\left(1-\left|a_{n}\right|\right) & \leqslant \mathrm{C} \gamma \sum_{\substack{a_{n} \in \mathbf{R}(\boldsymbol{J})}}\left(1-\left|a_{n}\right|\right)  \tag{26}\\
& \leqslant \mathrm{C} \gamma \mathbf{M}|\mathbf{J}|
\end{align*}
$$

and (22) as consequence of (25), (26).

The proof of Proposition 3 follows at this point by a standard reasoning of constructing successive generations of intervals in $\Pi$. Take $M=100 C_{4} \log \frac{1}{\varepsilon}, \gamma^{-1}=200 C_{4} C_{5} \log \frac{1}{\varepsilon}$ and

$$
\delta(\varepsilon)=\exp \left(-2 \mathrm{C}_{5} \mathrm{M} \log \frac{1}{\gamma}\right)=\exp \left(-C \log \frac{1}{\varepsilon}\left(\log \log \frac{1}{\varepsilon}\right)\right)
$$

Start with $\mathscr{F}^{(1)}=\{\Pi\}$. Assume now the generation $\mathscr{F}^{(s)}$ obtained and J an interval in $\mathscr{F}^{(s)}$. Let $\mathscr{D}(\mathrm{J})$ be the maximal diadic subintervals I of J such that the upperhalf of $\mathrm{R}(\mathrm{I})$ contains a point $a$ where $|\mathrm{B}(a)|>\varepsilon$. Hence

$$
|B| \leqslant \varepsilon \quad \text { on } \quad R(J) \backslash \bigcup_{I \in \mathscr{D}(J)} R(I)
$$

To each $I \in \mathscr{D}(J)$, we apply lemma's 2 and 3, providing intervals $\left\{I_{k}\right\}$ and a region $O(I)$ of $R(I)$. Define

$$
\mathscr{F}^{(s+1)}=\bigcup_{J \in \mathscr{F}^{(s)}} \bigcup_{1 \in \mathscr{\mathscr { D }}(\mathrm{~J})}\left\{\mathrm{I}_{k} ; k=1,2, \ldots\right\}
$$

where for each $I \in \mathscr{D}(J)$, by construction

$$
\begin{equation*}
\Sigma\left|\mathrm{I}_{k}\right|<\frac{1}{100}|\mathrm{I}| \tag{27}
\end{equation*}
$$

Let $R_{s}(J)$ be the union of $R(J) \backslash \bigcup_{I \in \mathscr{D}(\mathrm{I})} R(I)$ and $\bigcup_{I \in \mathscr{D}(J)} O(I)$. Take $\mathrm{R}_{s}=\bigcup_{\mathrm{J} \in \mathscr{F}_{( }(s)} \mathrm{R}_{s}(\mathrm{~J})$. Thus, by (23) of Lemma 3, $|\mathrm{B}| \leqslant \varepsilon$ on $\mathrm{R}_{s}(\mathrm{~J})$, hence on $\mathrm{R}_{s}$.

Also, by (24) of Lemma 3

$$
|\mathrm{B}(z)|>\delta(\varepsilon) \quad \text { if } \quad z \in \bigcup_{\mathrm{J} \in \mathscr{F}^{(s)}} \mathrm{R}(\mathrm{~J}) \backslash\left(\mathrm{R}_{s} \cup \bigcup_{\mathrm{J} \in \mathscr{F}^{(s+1)}} \mathrm{R}(\mathrm{~J})\right)
$$

Define $R=\bigcup R_{s}$. Our construction yields $|B| \leqslant \varepsilon$ on $R$ and $|B| \geqslant \delta(\varepsilon)$ on $\mathrm{D} \backslash \mathrm{R}$.

As a consequence of (22) and (27) and the choice of $\gamma$,

$$
\left\|\lambda_{\partial R}\right\|_{C} \leqslant 10
$$

as the reader will easily check. This completes the proof.
