# BIHOLOMORPHIC MAPS DETERMINED ON THE BOUNDARY 

by Nozomu MOCHIZUKI

Let $\mathrm{X}, \mathrm{Y}$ be complex manifolds of pure dimension $n$ where the holomorphic functions on X separate points ; let D be a relatively compact open subset of X , and $\widetilde{\mathrm{D}}$ a neighborhood of $\overline{\mathrm{D}}$. Let $f: \widetilde{\mathrm{D}} \longrightarrow \mathrm{Y}$ be a holomorphic map. The object of the present note is to show under certain conditions that if $f$ is one-to-one when restricted to the boundary $b \mathrm{D}$ of D , then $f: \mathrm{D} \longrightarrow f(\mathrm{D})$ is biholomorphic. In case $\mathrm{X}=\mathrm{Y}=$ the complex plane, if $b \mathrm{D}$ is a rectifiable Jordan curve, then $f(\mathrm{D})$ is the domain surrounded by the curve $f(b \mathrm{D})$ and $f: \mathrm{D} \longrightarrow f(\mathrm{D})$ is conformal. A corollary is deduced to extend this theorem to the case of higher dimensions. We begin with a lemma which will be stated in a form a little more general than actually needed.

Lemma. - Let $f: \widetilde{\mathrm{D}} \longrightarrow \mathrm{Y}$ be a holomorphic map. If $f$ has finite fibres on $b \mathrm{D}$, then so does $f$ on D .

Proof. - Let $\mathrm{F}=\left\{p \in \widetilde{\mathrm{D}} \mid f(p)=q_{0}\right\}, q_{0} \in f(\mathrm{D})$, and suppose that $\mathrm{F} \cap \mathrm{D}$ is noncompact. Then $\mathrm{F} \cap b \mathrm{D} \neq \varnothing$; this constitutes a finite set of points $\left\{p_{1}, p_{2}, \ldots, p_{s}\right\}$. There exists a point $p_{i}$ such that $\mathrm{F} \cap \mathrm{D} \cap \mathrm{U} \neq \varnothing$ for every neighborhood U of $p_{i}$. We take mutually disjoint open neighborhoods $\mathrm{U}_{i}$ of $p_{i}$ in $\widetilde{\mathrm{D}}, i=1,2, \ldots, s$, for which $\mathrm{F} \cap \mathrm{U}_{i}=\mathrm{V}_{i}^{1} \cup \mathrm{~V}_{i}^{2} \cup \ldots \cup \mathrm{~V}_{i}^{m_{i}}$ is the decomposition of F into irreductible branches at $p_{i}$, and the sets $\mathrm{R}\left(\mathrm{V}_{i}^{m}\right)$ of regular points of $\mathrm{V}_{i}^{m}$ are connected manifolds which are dense in $\mathrm{V}_{i}^{m}$. There are a point $p_{j}$ and a branch $\mathrm{V}_{j}^{m}$ such that $\mathrm{V}_{j}^{m} \cap \mathrm{D} \neq \varnothing$ and $\mathrm{V}_{j}^{m}-\widetilde{\mathrm{D}} \neq \phi$, because, if this is not the case, then $\mathrm{F} \cap \mathrm{D}$ and all the branches contained
in $\overline{\mathrm{D}}$ constitute a compact subvariety of $\mathrm{D} \cup \bigcup_{i=1}^{s} \mathrm{U}_{i}$, so that $\mathrm{F} \cap \mathrm{D}$ becomes a finite set of points. The dimension of such a variety $\mathrm{V}_{j}^{m}$ at $p_{j}$ is positive. We choose $p_{1}^{\prime} \in \mathrm{R}\left(\mathrm{V}_{j}^{m}\right) \cap \mathrm{D}$ and $p_{2}^{\prime} \in \mathrm{R}\left(\mathrm{V}_{j}^{m}\right)-\overline{\mathrm{D}}$. Then there is a curve in the connected manifold $\mathrm{R}\left(\mathrm{V}_{j}^{m}\right)-\left\{p_{j}\right\}$ which joins $p_{1}^{\prime}$ to $p_{2}^{\prime}$, and this must intersect $b \mathrm{D}$. But this is impossible, and the proof is completed.

In what follows, differentiability will mean that of $\mathrm{C}^{\infty}$. We denote by $\partial \mathrm{D}$ the totality of regular points of $b \mathrm{D}$; that is, $p_{0} \in \partial \mathrm{D}$ if and only if $p_{0} \in b \mathrm{D}$ and there exist a neighborhood U of $p_{0}$ and a differentiable coordinate system $\phi=\left(x_{1}, x_{2}, \ldots, x_{2 n}\right): \mathrm{U} \longrightarrow \Delta(0 ; \epsilon)$, the $\epsilon$-cube in $\mathrm{R}^{2 n}$ centered at the origin 0 , such that

$$
\phi\left(p_{0}\right)=0, \quad \overline{\mathrm{D}} \cap \mathrm{U}=\left\{p \in \mathrm{U} \mid x_{2 n}(p) \geqslant 0\right\}
$$

Theorem. - Let D be a relatively compact open subset of X such that $\partial \mathrm{D} \neq \varnothing$. If $f$ is one-to-one on $b \mathrm{D}$ and $f(\mathrm{D})-f(b \mathrm{D})$ is connected, then $f: \mathrm{D} \longrightarrow f(\mathrm{D})$ is biholomorphic.

Proof. - We may assume that X and Y have countable bases for open sets. Note that $f: \mathrm{D} \longrightarrow \mathrm{Y}$ is an open map by the above lemma. Let $\mathrm{G}=f(\mathrm{D}), \mathrm{G}_{0}=\mathrm{G}-f(b \mathrm{D})$, and $\mathrm{D}_{0}=\mathrm{D}-f^{-1}(f(b \mathrm{D})) . \mathrm{G}_{0}$ is dense in G , since $f: b \mathrm{D} \longrightarrow f(b \mathrm{D})$ is a homeomorphism. Let

$$
\mathrm{S}=\left\{p \in \widetilde{\mathrm{D}} \mid \operatorname{rank}_{p} f<n\right\}
$$

By Sard's theorem, $\mathrm{D} \cap \mathrm{S}$ is a nowhere dense analytic subvariety of $D$, so it can be assumed, by shrinking $\widetilde{D}$ if necessary, that $S$ is nowhere dense in $\widetilde{\mathrm{D}}$. The restricted $\operatorname{map} f: \mathrm{D}_{0} \longrightarrow \mathrm{G}_{0}$ is proper, and

$$
f_{0}: \mathrm{D}_{0}-f^{-1}\left(f\left(\mathrm{D}_{0} \cap \mathrm{~S}\right)\right) \longrightarrow \mathrm{G}_{0}-f\left(\mathrm{D}_{0} \cap \mathrm{~S}\right)
$$

is a finitely sheeted covering map. $\mathrm{G}_{0}-f\left(\mathrm{D}_{0} \cap \mathrm{~S}\right)$ is dense in G ; it follows that if $f_{0}$ is one-to-one, then so is $f: \mathrm{D} \longrightarrow \mathrm{G}$. For the differentiable map $f: \mathrm{D}_{0} \longrightarrow \mathrm{G}_{0}$, the connectedness of $\mathrm{G}_{0}$ guarantees the existence of a constant $\delta$, the degree of $f$, such that if $\omega$ is a 2 n form of compact support in $G_{0}$ then

$$
\int_{\mathrm{D}_{0}} f^{*} \omega=\delta \int_{\mathrm{G}_{0}} \omega ;
$$

this $\delta$ coincides with the number of sheets of the covering map $f_{0}([1])$. Thus, we have only to show that $\delta=1$.

We shall show that $f(\partial \mathrm{D}-\mathrm{S}) \subset \partial \mathrm{G}$, where it should be noted that $\partial \mathrm{D} \not \subset \mathrm{S}$ since $\partial \mathrm{D}$ is a real $(2 n-1)$-dimensional manifold. Let $p_{0} \in \partial \mathrm{D}-\mathrm{S}, q_{0}=f\left(p_{0}\right)$. We take an open neighborhood $\mathrm{U}^{\prime}$ of $p_{0}$ in $\widetilde{\mathrm{D}}$ such that $f^{\prime}=f \mid \mathrm{U}^{\prime}: \mathrm{U}^{\prime} \longrightarrow \mathrm{V}^{\prime}$ is biholomorphic where $\mathrm{V}^{\prime}$ is a neighborhood of $q_{0}$. We assume that

$$
\phi=\left(x_{1}, x_{2}, \ldots, x_{2 n}\right): \mathrm{U}^{\prime} \longrightarrow \Delta(0 ; \epsilon)
$$

is a coordinate system for which

$$
\phi\left(p_{0}\right)=0, \quad \overline{\mathrm{D}} \cap \mathrm{U}^{\prime}=\left\{p \in \mathrm{U}^{\prime} \mid x_{2 n}(p) \geqslant 0\right\}
$$

Let $y_{i}=x_{i} \circ f^{\prime-1}, i=1,2, \ldots, 2 n$, then

$$
\psi=\left(y_{1}, y_{2}, \ldots, y_{2 n}\right): \mathrm{V}^{\prime} \longrightarrow \Delta(0 ; \epsilon)
$$

is a coordinate system for $V^{\prime}$. Suppose that $q_{0} \in G$ and $V^{\prime} \subset G$. Since $q_{0} \notin f\left(b \mathrm{D}-\mathrm{U}^{\prime}\right)$, we can find $\mathrm{V}=\psi^{-1}(\Delta(0 ; \rho)), 0<\rho<\epsilon$, so that $\mathrm{V} \cap f\left(b \mathrm{D}-\mathrm{U}^{\prime}\right)=\varnothing$. Put $\mathrm{U}=f^{\prime-1}(\mathrm{~V})$. Let $\omega$ be a $2 n$-form : $\omega=g d y_{1} \wedge d y_{2} \wedge \ldots \wedge d y_{2 n}$ where $g$ is a differentiable function of compact support in V. Let $\left\{\rho_{k}\right\},\left\{\rho_{k}^{\prime}\right\}$ be sequences of positive numbers such that

$$
\rho_{1}<\rho_{2}<\ldots<\rho, \rho_{k} \longrightarrow \rho ; \rho_{1}>\rho_{1}^{\prime}>\rho_{2}^{\prime}>\ldots, \rho_{k}^{\prime} \longrightarrow 0
$$

and let

$$
\mathrm{Q}_{k}=\left\{q \in \mathrm{~V}| | y_{i}(q)\left|<\rho_{k}, 1 \leqslant i \leqslant 2 n-1 ; \rho_{k}^{\prime}<\left|y_{2 n}(q)\right|<\rho_{k}\right\}\right.
$$

$k=1,2, \ldots$. Note that $\mathrm{Q}_{k} \subset \mathrm{G}_{0}$. We choose differentiable functions $g_{k}$ with the property that

$$
g_{k}(q)=\left\{\begin{array}{cl}
g(q) & , q \in \overline{\mathrm{Q}}_{k} \\
0 & , q \in \mathrm{Y}-\mathrm{Q}_{k+1}
\end{array}\right.
$$

and $\left|g_{k}(q)\right| \leqslant$ const. for all $q \in \mathrm{Y}$ and $k$. Putting $\omega_{k}=g_{k} d y_{1}$ $\wedge d y_{2} \wedge \ldots \wedge d y_{2 n}$, we have

$$
\int_{\mathrm{D}} f^{*} \omega_{k}=\delta \int_{\mathrm{G}} \omega_{k} \quad, \quad k=1,2, \ldots
$$

Let $\mathrm{H}=\mathrm{D}-\overline{\mathrm{U}}$, then $\left(\operatorname{supp} f^{*} \omega\right) \cap \overline{\mathrm{D}} \subset \mathrm{H} \cup(\overline{\mathrm{D}} \cap \mathrm{U})$. The set $\mathrm{E}=\left\{q \in \mathrm{~V} \mid y_{2 n}(q)=0\right\}$ is of measure zero in Y and, since $f$ is locally biholomorphic on $\widetilde{D}-S$,

$$
f^{-1}(\mathrm{E}) \cap \overline{\mathrm{D}}=\left(f^{-1}(\mathrm{E}) \cap \overline{\mathrm{D}} \cap \mathrm{~S}\right) \cup\left(f^{-1}(\mathrm{E}) \cap(\overline{\mathrm{D}}-\mathrm{S})\right)
$$

is also of measure zero. Therefore, $g_{k} \longrightarrow g$, a.e., on $\overline{\mathrm{G}}$ and

$$
g_{k} \circ f \longrightarrow g \circ f
$$

a.e., on $H \cup(\overline{\mathrm{D}} \cap \mathrm{U})$. Thus, we obtain

$$
\mathrm{I}=\lim _{k \rightarrow \infty} \int_{\mathrm{D}} f^{*} \omega_{k}=\int_{\mathrm{H}} f^{*} \omega+\int_{\mathrm{D} \cap \mathrm{U}} f^{*} \omega, \mathrm{I}=\delta \int_{\mathrm{G}} \omega .
$$

Let $h$ be a nonnegative differentiable function of compact support in V such that $h\left(q_{0}\right)>0$ and let $\theta=h d y_{1} \wedge \ldots \wedge d y_{2 n-1}$. The support of $f^{*} \theta$ in H is compact, so we get from the preceding formula applied to $\omega=d \theta$

$$
\mathrm{I}=\int_{\mathrm{D} \cap \mathrm{U}} d\left(f^{*} \theta\right)=\int_{\partial \mathrm{D} \cap \mathrm{U}} f^{*} \theta=\int_{\mathrm{E}} \theta>0, \quad \mathrm{I}=\delta \int_{\mathrm{G}} d \theta=0
$$

a contradiction. Thus, we have proved $f(\partial \mathrm{D}-\mathrm{S}) \subset b \mathrm{G}$. Now take $\mathrm{U}^{\prime}, \mathrm{V}^{\prime}$ as in the above. Since $f\left(\partial \mathrm{D} \cap \mathrm{U}^{\prime}\right) \subset b \mathrm{G} \subset f(b \mathrm{D})$ where $f\left(\partial \mathrm{D} \cap \mathrm{U}^{\prime}\right)$ is open in $f(b \mathrm{D})$, we can find a neighborhood W of $q_{0}$ in $\mathrm{V}^{\prime}$ so that $b \mathrm{G} \cap \mathrm{W} \subset f\left(\partial \mathrm{D} \cap \mathrm{U}^{\prime}\right)$. Take $\mathrm{V}=\psi^{-1}(\Delta(0 ; \rho))$ in W such that $\mathrm{V} \cap f\left(b \mathrm{D}-\mathrm{U}^{\prime}\right)=\varnothing$, and let $\mathrm{U}=f^{\prime-1}(\mathrm{~V})$. We see that $b \mathrm{G} \cap \mathrm{V}=f(\partial \mathrm{D} \cap \mathrm{U})$. V is decomposed as follows :

$$
\begin{aligned}
\mathrm{V} & =f(\mathrm{D} \cap \mathrm{U}) \cup f(\partial \mathrm{D} \cap \mathrm{U}) \cup f(\mathrm{U}-\overline{\mathrm{D}}) \\
& =(\mathrm{G} \cap \mathrm{~V}) \cup(b \mathrm{G} \cap \mathrm{~V}) \cup(\mathrm{V}-\overline{\mathrm{G}}),
\end{aligned}
$$

where $f(\mathrm{D} \cap \mathrm{U}) \subset \mathrm{G} \cap \mathrm{V}, \mathrm{V}-\overline{\mathrm{G}} \subset f(\mathrm{U}-\overline{\mathrm{D}})$. Suppose that

$$
V-\bar{G}=\phi
$$

Then, from $\mathrm{V}-f(\partial \mathrm{D} \cap \mathrm{U}) \subset \mathrm{G}$, we can deduce a contradiction just as in the above. Thus, $V-\bar{G} \neq \varnothing$ and, from the connectedness of $f(\mathrm{U}-\overline{\mathrm{D}})$, we see that $f(\mathrm{U}-\overline{\mathrm{D}}) \cap \mathrm{G} \cap \mathrm{V}=\phi$, which implies that $f(\mathrm{D} \cap \mathrm{U})=\mathrm{G} \cap \mathrm{V}$. It follows that

$$
\mathrm{G} \cap \mathrm{~V}=\left\{q \in \mathrm{~V} \mid y_{2 n}(q)>0\right\}
$$

and $\quad b \mathrm{G} \cap \mathrm{V}=\partial \mathrm{G} \cap \mathrm{V} . \quad$ In the present situation, let

$$
\mathrm{Q}_{k}=\left\{q \in \mathrm{~V}| | y_{i}(q) \mid<\rho_{k}, \rho_{k}^{\prime}<y_{2 n}(q)<\rho_{k}\right\}, k=1,2, \ldots
$$

and choose $g_{k}$ as before for $\omega=g d y_{1} \wedge d y_{2} \wedge \ldots \wedge d y_{2 n}$. For $\omega=d \theta$, we have

$$
\mathrm{I}=\int_{\partial \mathrm{D} \cap \mathrm{U}} f^{*} \theta=\int_{\partial \mathrm{G} \cap \mathrm{~V}} \theta, \mathrm{I}=\delta \int_{\mathrm{G}} d \theta=\delta \int_{\partial \mathrm{G} \cap \mathrm{~V}} \theta ;
$$

these yield $\delta=1$. This completes the proof.
As a typical example in which the condition of Theorem is satisfied, we deal with the following case.

Corollary. - Let D be a bounded open subset of the complex $n$-space $\mathrm{C}^{n}$ such that $b \mathrm{D}$ is topologically $a(2 n-1)$-dimensional sphere in $\mathrm{R}^{2 n}$ with $\partial \mathrm{D} \neq \varnothing$, and let $f: \widetilde{\mathrm{D}} \longrightarrow \mathrm{C}^{n}$ be holomorphic. If $f$ is one-to-one on $b \mathrm{D}$, then $f: \mathrm{D} \longrightarrow f(\mathrm{D})$ is biholomorphic where $f(\mathrm{D})$ is the domain surrounded by the sphere $f(b \mathrm{D})$.

Proof. $-f(b \mathrm{D})$ is a $(2 n-1)$-sphere in $\mathbf{C}^{n}$, so that $\mathrm{C}^{n}-f(b \mathrm{D})$ is decomposed into two components G and $\mathrm{G}^{\prime}$ with $f(b \mathrm{D})=b \mathrm{G}=b \mathrm{G}^{\prime}$. Let G be the bounded component. Let $f(\mathrm{D}) \cap \mathrm{G}^{\prime} \neq \varnothing$. If $\mathrm{G}^{\prime} \not \subset f(\mathrm{D})$, then $b f(\mathrm{D}) \cap \mathrm{G}^{\prime} \neq \phi$, which contradicts $b f(\mathrm{D}) \subset f(b \mathrm{D})$; hence we have $\mathrm{G}^{\prime} \subset f(\mathrm{D})$, which contradicts the boundedness of $f(\mathrm{D})$. Thus, $f(\mathrm{D}) \subset$ G. It follows from the same reasoning that $f(\mathrm{D})=\mathrm{G}$. We have $f(b \mathrm{D})=b f(\mathrm{D})$, and the proof is completed.
