# HOMOGENEOUS HESSIAN MANIFOLDS 

by Hirohiko SHIMA

## Introduction.

In [8] [9] [10] we introduced the notion of Hessian manifolds and studied the geometry of such manifolds. We first recall the definition of Hessian manifolds (*). Let $M$ be a flat affine manifold, i.e., M admits open charts $\left(\mathrm{U}_{\alpha},\left\{x_{\alpha}^{1}, \ldots, x_{\alpha}^{n}\right\}\right)$ such that $\mathrm{M}=\cup \mathrm{U}_{\alpha}$ and whose coordinate changes are all affine functions. Such local coordinate systems $\left\{x_{\alpha}^{1}, \ldots, x_{\alpha}^{n}\right\}$ will be called affine local coordinate systems. Throughout this paper the local expressions for geometric concepts on $M$ will be given in terms of affine local coordinate systems.

A Riemannian metric $g$ on M is said to be Hessian if for each point $p \in \mathrm{M}$ there exists a $\mathrm{C}^{\infty}$-function $\phi$ defined on a neighbourhood of $p$ such that $g_{i j}=\frac{\partial^{2} \phi}{\partial x^{i} \partial x^{j}}$. Let D denote the covariant differential with respect to the flat affine structure on M. Using $D$ we may define the exterior differentiation for cotangent bundle valued forms. We know that a Riemannian metric $g$ is Hessian if and only if the cotangent bundle valued 1 -form $g^{0}$ corresponding to $g$ has an exterior differential zero [8];

$$
\mathrm{D}_{\mathrm{X}} g^{0}(\mathrm{Y})-\mathrm{D}_{\mathrm{Y}} g^{0}(\mathrm{X})-g^{0}([\mathrm{X}, \mathrm{Y}])=0
$$

for all vector fields $X, Y$ on $M$. A flat affine manifold provided

[^0]with a Hessian metric is called a Hessian manifold. As we see (Proposition 0.1), the tangent bundle over a Hessian manifold admits in a natural way a Kählerian structure. Thus the geometry of Hessian manifolds is related with that of certain Kählerian manifolds.

Let M be a Hessian manifold. A diffeomorphism of M onto itself is called an automorphism of $M$ if it preserves both the flat affine structure and the Hessian metric. The set of all automorphisms of $M$, denoted by $\operatorname{Aut}(\mathrm{M})$, forms a Lie group. A Hessian manifold $M$ is said to be homogeneous if the group $\operatorname{Aut}(\mathrm{M})$ acts transitively on M.

For homogeneous Kählerian manifolds Vinberg and Gindikin proposed the following conjecture and settled the related problems [1] [14].

Every homogeneous Kählerian manifolds admits a holomorphic fibering, whose base space is holomorphically isomorphic with a homogeneous bounded domain, and whose fiber is, with the induced Kählerian structure, isomorphic with the direct product of a locally flat homogeneous Kählerian manifold and a simply connected compact homogeneous Kählerian manifold.

In this paper we consider analogous problems for homogeneous Hessian manifolds and obtain the following results.

Main Theorem. - Let M be a connected homogeneous Hessian manifold. Then we have

1) The domain of definition $\mathrm{E}_{x}$ for the exponential mapping $\exp _{x}$ at $x \in \mathrm{M}$ given by the flat affine structure is a convex domain. Moreover $\mathrm{E}_{x}$ is the universal covering manifold of M with affine projection $\exp _{x}: \mathrm{E}_{x} \longrightarrow \mathrm{M}$.
2) The universal covering manifold $\mathrm{E}_{x}$ of M has a decomposition $\mathrm{E}_{x}=\mathrm{E}_{x}^{0}+\mathrm{E}_{x}^{+}$where $\mathrm{E}_{x}^{0}$ is a uniquely determined vector subspace of the tangent space $\mathrm{T}_{x} \mathrm{M}$ of M at $x$ and $\mathrm{E}_{x}^{+}$is an affine homogeneous convex domain not containing any full straight line. Thus $\mathrm{E}_{x}$ admits a unique fibering with the following properties:
(i) The base space is $\mathrm{E}_{x}^{+}$.
(ii) The projection $p: \mathrm{E}_{x} \longrightarrow \mathrm{E}_{x}^{+}$is given by the canonical projection from $\mathrm{E}_{x}=\mathrm{E}_{x}^{0}+\mathrm{E}_{x}^{+}$onto $\mathrm{E}_{x}^{+}$.
(iii) The fiber $\mathrm{E}_{x}^{0}+v$ through $v \in \mathrm{E}_{x}$ is characterized as the set of all points which can be joined with $v$ by full straight lines contained in $\mathrm{E}_{x}$. Moreover each fiber is an affine subspace of $\mathrm{T}_{x} \mathrm{M}$ and is a Euclidean space with respect to the induced metric.
(iv) Every automorphism of $\mathrm{E}_{x}$ is fiber preserving.
(v) The group of automorphisms of $\mathrm{E}_{x}$ which preserve every fiber, acts transitively on the fibers.

Corollary 1. - Let $\beta$ denote the canonical bilinear form on a connected homogeneous Hessian manifold $\mathrm{M} ; \beta_{i j}=\frac{\partial^{2} \log \mathrm{~F}}{\partial x^{i} \partial x^{j}}$ where $\mathrm{F}=\sqrt{\operatorname{det}\left[g_{i j}\right]}$. Then we have
(i) $\beta$ is positive semi-definite.
(ii) The null space of $\beta$ at $x \in \mathrm{M}$ coincides with $\mathrm{E}_{x}^{0}$. In particular
(iii) $\beta=0$ if and only if $\mathrm{E}_{\boldsymbol{x}}=\mathrm{T}_{\boldsymbol{x}} \mathrm{M}$ and it is a Euclidean space with respect to the induced metric.
(iv) $\beta$ is positive definite if and only if $\mathrm{E}_{x}$ is an affine homogeneous convex domain not containing any full straight line.

In [5] Kobayashi considered pseudo-distances $c_{\mathrm{M}}^{a}, c_{\mathrm{M}}, d_{\mathrm{M}}^{a}$ and $d_{\mathrm{M}}$ on a flat affine (more generally flat projective) manifold M (see also [11]).

Corollary 2. - Let M be a connected homogeneous Hessian manifold and let $d$ be one of the pseudo-distances on $\mathrm{E}_{x}$ listed above. Then the fiber through a point $v \in \mathrm{E}_{x}$ is characterized by the set of all points $w \in \mathrm{E}_{x}$ such that $d(v, w)=0$. In particular we have:
(i) $d=0$ if and only if $\mathrm{E}_{x}=\mathrm{T}_{x} \mathrm{M}$ and it is a Euclidean space with respect to the induced metric.
(ii) $d$ is a distance on $\mathrm{E}_{x}$ if and only if $\mathrm{E}_{x}$ is an affine homogeneous convex domain not containing any full straight line.

Corollary 3. - Let M be a connected homogeneous Hessian manifold. If there is no affine map of $\mathbf{R}$ into $\mathbf{M}$ except for constant
maps, then the universal covering manifold of M is an affine homogeneous convex domain not containing any full straight line.

Corollary 4. - If a connected Lie subgroup G of Aut(M) acts transitively on a Hessian manifold M and if the isotropy subgroup of G at a point in M is discrete, then G is a solvable Lie group.

Corollary 5. - If a connected homogeneous Hessian manifold M admits a transitive reductive Lie subgroup of $\operatorname{Aut}(\mathrm{M})$, then the universal covering manifold of M is a direct product of a Euclidean space and an affine homogeneous convex self-dual cone not containing any full straight line.

Corollary 6. - A compact connected homogeneous Hessian manifold is a Euclidean torus.

At the conclusion of this introduction we show the relation between Hessian manifolds and Kählerian manifolds. Let $M$ be a flat affine manifold and let $\pi: \mathrm{TM} \longrightarrow \mathrm{M}$ be the tangent bundle over $M$ with projection $\pi$. Then the space $T M$ admits in a natural way a complex structure induced by the flat affine structure on M . Indeed, for an affine local coordinate system $\left\{x^{1}, \ldots, x^{n}\right\}$ we put $z^{i}=y^{i}+\sqrt{-1} y^{n+i}$ where $y^{i}=x^{i} \circ \pi, y^{n+i}=d x^{i}, \quad i=1, \ldots, n$. The systems $\left\{z^{1}, \ldots, z^{n}\right\}$ defined as above give a complex structure on TM (cf. [2]).

Let $g$ be a Riemannian metric on $M$. If we set

$$
g^{\mathrm{T}}=\sum_{i, j=1}^{n}\left(g_{i j} \circ \pi\right) d z^{i} d \bar{z}^{j}
$$

then $g^{T}$ is a Hermitian metric on $T M$ (the definition of $g^{T}$ is independent of the choice of affine local coordinate systems).

Proposition 0.1. - A Riemannian metric $g$ on M is Hessian if and only if the corresponding Hermitian metric $g^{\mathrm{T}}$ on TM is Kählerian.

Proof. - Since the fundamental 2-form $\rho$ of the Hermitian metric $g^{T}$ is expressed locally as

$$
\rho=2 \sum_{i, j=1}^{n}\left(g_{i j} \circ \pi\right) d y^{i} \wedge d y^{n+j}
$$

we know that $d \rho=0$ if and only if $\frac{\partial g_{i j}}{\partial x^{k}}=\frac{\partial g_{k j}}{\partial x^{i}}$, which is equivalent to $g$ being Hessian (cf. [8]). q.e.d.

## 1. Proof of Main Theorem 1) .

In this section we prove the first part of Main Theorem along the same line as Koszul [6] [7]. Let $M$ be a Hessian manifold with Hessian metric $g$. A $\mathrm{C}^{\infty}$-function $\phi$ defined on an open set U in M is called a primitive of $g$ on $U$ if it satisfies the condition $g_{i j}=\frac{\partial^{2} \phi}{\partial x^{i} \partial x^{j}}$ on a neighbourhood of each point in U .

From now on we always assume that $M$ is a connected homogeneous Hessian manifold.

Lemma 1.1. - Let $\left\{x^{1}, \ldots, x^{n}\right\}$ be an affine local coordinate system in U . If $\phi$ is a primitive of $g$ on U , then $\frac{\partial \phi}{\partial x^{j}}(j=1, \ldots, n)$ are regular rational functions in $x^{1}, \ldots, x^{n}(*)$.

Proof. - Let $g$ be the Lie algebra of the automorphism group Aut(M). For $X \in g$ we denote by $X^{*}$ the vector field on $M$ induced by $\exp (-\mathbf{t X})$. For fixed $p \in \mathrm{U}$ there exist a neighbourhood W of $p$ in $U$ and elements $X_{1}, \ldots, X_{n}$ in $g$ such that the values of the vector fields $\mathrm{X}_{1}^{*}, \ldots, \mathrm{X}_{n}^{*}$ at each point $q \in \mathrm{~W}$ form a basis of the tangent space of M at $q$. So we have $\frac{\partial}{\partial x^{j}}=\sum_{i} \eta_{j}^{i} \mathrm{X}_{i}^{*}$ on W , where each $\eta_{j}^{i}$ is a $\mathrm{C}^{\infty}$-function on W . Since $\mathrm{X}_{i}^{*}$ is an infinitesimal affine transformation, the components $\xi_{i}^{j}$ of $\mathrm{X}_{i}^{*}=\sum_{j} \xi_{i}^{j} \frac{\partial}{\partial x^{j}}$ are affine functions in $x^{1}, \ldots, x^{n}$. Therefore $\eta_{j}^{i}$ are rational functions in $x^{1}, \ldots, x^{n}$. Since $\mathrm{X}^{*}=\sum_{j} \xi^{j} \frac{\partial}{\partial x^{j}}(\mathrm{X} \in g)$ is an infini-

[^1]tesimal isometry and its components are affine functions, we get $\frac{\partial^{2} X^{*} \phi}{\partial x^{i} \partial x^{j}}=\sum_{p} \frac{\partial \xi^{p}}{\partial x^{i}} g_{p j}+\sum_{p} \frac{\partial \xi^{p}}{\partial x^{j}} g_{p i}+\sum_{p} \xi^{p} \frac{\partial g_{i j}}{\partial x^{p}}=0$, and so $\mathrm{X}^{*} \phi$ is an affine function in $x^{1}, \ldots, x^{n}$. Thus $\frac{\partial \phi}{\partial x^{j}}=\sum_{i} \eta_{j}^{i} \mathrm{X}_{i}^{*} \phi$ is a regular rational function in $x^{1}, \ldots, x^{n}$ on W , and also on U because $p$ is an arbitrary point in U .

We now need the following lemma due to Koszul [7].

Lemma 1.2. - Let M be a connected flat affine manifold and let $\mathrm{E}_{x}$ be the domain of definition for the exponential mapping $\exp _{x}$ at $x \in \mathrm{M}$ given by the flat affine structure. Then $\exp _{x}$ is an affine mapping from $\mathrm{E}_{x}$ to M and its rank is maximum at every point in $\mathrm{E}_{x}$ and equal to $\operatorname{dim} \mathrm{M}$. Moreover if $\mathrm{E}_{x}$ is convex it is the universal covering manifold of M with covering projection $\exp _{x}$.

It follows from this lemma that the induced metric $\tilde{g}=\exp _{x}^{*} g$ on $\mathrm{E}_{x}$ is Hessian.

Lemma 1.3. - There exists a primitive $\psi$ of $\widetilde{g}$ on $\mathrm{E}_{x}$.
Proof. - Let $\left\{y^{1}, \ldots, y^{n}\right\}$ be an affine coordinate system on $\mathrm{T}_{x} \mathrm{M}$. Define a 1-form $\gamma_{i}$ on $\mathrm{E}_{x}$ by $\gamma_{i}=\sum_{j} \tilde{g}_{i j} d y^{j}$. We have then $d \gamma_{i}=\sum_{k<j}\left(\frac{\partial \widetilde{g}_{i j}}{\partial y^{k}}-\frac{\partial \widetilde{g}_{i k}}{\partial y^{j}}\right) d y^{k} \wedge d y^{j}=0$. Since $\mathrm{E}_{x}$ is starshaped with respect to the origin 0 , by Poincaré Lemma there exists a $\mathrm{C}^{\infty}$-function $h_{i}$ on $\mathrm{E}_{\boldsymbol{x}}$ such that $\gamma_{i}=d h_{i}$. If we define a 1 -form $\gamma$ on $\mathrm{E}_{x}$ by $\gamma=\sum_{i} h_{i} d y^{i}$, we get $d \gamma=\sum_{j<i}\left(\frac{\partial h_{i}}{\partial y^{j}}-\frac{\partial h_{j}}{\partial y^{i}}\right) d y^{j} \wedge d y^{i}=0$. Again by Poincaré Lemma there exists a $\mathrm{C}^{\infty}$-function $\psi$ such that $\gamma=d \psi$. Thus we have $\tilde{g}_{i j}=\frac{\partial^{2} \psi}{\partial y^{i} \partial y^{j}}$.

Lemma 1.4 (Koszul [6]). - Let $a$ be an element in $\mathrm{T}_{x} \mathrm{M}$ such that $t a \in \mathrm{E}_{x}$ for $0 \leqslant t<1$ and $a \notin \mathrm{E}_{x}$. Then we have

$$
\lim _{t \rightarrow 1} \psi(t a)=\infty,
$$

where $\psi$ is a primitive of $\tilde{g}$ on $\mathrm{E}_{x}$.

Proof. - The length of the curve $\exp _{x}(t a)(0 \leqslant t<\theta)$ with respect to $g$ is given by

$$
1(\theta)=\int_{0}^{\theta} g\left(\exp _{x}(t a), \exp _{x}(t a)\right)^{1 / 2} d t=\int_{0}^{\theta}\left(\frac{d \mathrm{~F}}{d t}\right)^{1 / 2} d t
$$

where $\mathrm{F}(t)=\frac{d}{d t} \psi(t a)$. Since the Riemannian metric $g$ on M is complete because $M$ is homogeneous, we have

$$
\lim _{\theta \rightarrow 1} 1(\theta)=\lim _{\theta \rightarrow 1} \int_{0}^{\theta}\left(\frac{d \mathrm{~F}}{d t}\right)^{1 / 2} d t=\infty
$$

For each $0 \leqslant t_{0}<1$ there exists a primitive $\phi_{t_{0}}$ defined on a neighbourhood of $\exp _{x}\left(t_{0} a\right)$ such that $\psi=\phi_{t_{0}} \circ \exp _{x}$ and so by Lemma 1.1 and 1.2 $\mathrm{F}(t)$ is a regular rational function in $t(0 \leqslant t<1)$. This together with $\lim _{\theta \rightarrow 1} \int_{0}^{\theta}\left(\frac{d \mathrm{~F}}{d t}\right)^{1 / 2} d t=\infty$ means that $\mathrm{F}(t)$ has a pole of order $\geqslant 1$ at $t=1$. Thus we get

$$
\lim _{t \rightarrow 1} \psi(t a)=\lim _{\theta \rightarrow 1} \int_{0}^{\theta} \mathrm{F}(t) d t+\psi(0)=\infty
$$

According to Lemma 1.4, Lemma 4.2 in [6] and the fact that $\mathrm{E}_{x}$ is star-shaped with respect to the origin $0, \mathrm{E}_{x}$ is a convex domain in $\mathrm{T}_{x} \mathrm{M}$. Moreover by Lemma $1.2 \mathrm{E}_{x}$ is the universal covering manifold of $M$ with projection $\exp _{x}: E_{x} \longrightarrow M$. Thus Main Theorem 1 ) is completely proved.

## 2. Normal Hessian algebras.

Let $\Omega$ be an affine homogeneous domain in $\mathbf{R}^{n}$ with an invariant Hessian metric $g$. In this section we first show that $\Omega$ admits a simply transitive triangular subgroup of $\operatorname{Aut}(\Omega)$ and using this we construct a normal Hessian algebra (Definition 2.3). According to Theorem 2.1 the study of affine homogeneous domains with invariant Hessian metric is reduced to that of normal Hessian algebras.

Let $\mathrm{A}(n)$ denote the group of all affine transformations of $\mathbf{R}^{n}$ and $\operatorname{Aff}(\Omega)$ the set of all elements in $\mathrm{A}(n)$ leaving $\Omega$ invariant. Then it is easy to see that $\operatorname{Aff}(\Omega)$ is a closed subgroup of $\mathrm{A}(n)$. Denoting by $I(\Omega)$ the group of all isometries of $\Omega$ with respect
to the Hessian metric $g$ it follows $\operatorname{Aut}(\Omega)=\operatorname{Aff}(\Omega) \cap \mathrm{I}(\Omega)$. A subgroup of $\mathrm{A}(n)$ is said to be algebraic if it is selected from $\mathrm{A}(n)$ by polynomial equations connecting the coefficients of an affine transformation in an affine coordinate system.

Lemma 2.1. - Let N be the normalizer of the identity component of $\operatorname{Aff}(\Omega)$ in $\mathrm{A}(n)$. Then N is algebraic and $\mathrm{N}, \operatorname{Aff}(\Omega)$ have the same identity component.

For the proof see Vinberg [13].
Proposition 2.1. - The identity component $\operatorname{Aut}_{\mathbf{0}}(\Omega)$ of $\operatorname{Aut}(\Omega)$ coincides with that of an algebraic group in $\mathrm{A}(n)$.

Proof. - Let $\left\{x^{1}, \ldots, x^{n}\right\}$ be an affine coordinate system on $\mathbf{R}^{n}$. For $a \in \mathrm{~A}(n)$ we denote by $\mathbf{f}(a)=\left[\mathbf{f}(a)_{j}^{i}\right]$ and $\mathbf{q}(a)=\left[\mathbf{q}(a)^{i}\right]$ the linear part and the translation part of $a$ respectively, where $x^{i} \circ a=\sum_{j} \mathrm{f}(a)_{j}^{i} x^{j}+\mathbf{q}(a)^{i}$. An element $a \in \operatorname{Aff}(\Omega)$ is contained in $\mathrm{I}(\Omega)$ if and only if $\sum_{r, s} f(a)_{i}^{r} f(a)_{j}^{s} g_{r s}(a p)=g_{i j}(p)$ holds for all $p \in \Omega$. Let $\phi$ be a primitive of $g$ on $\Omega$. Then by Lemma 1.1 the functions $g_{i j}=\frac{\partial^{2} \phi}{\partial x^{i} \partial x^{j}}$ defined on $\Omega$ are rational functions in $x^{1}, \ldots, x^{n}$. Therefore we may regard $g_{i j}$ as rational functions on $\mathrm{R}^{n}$ with respect to $x^{1}, \ldots, x^{n}$. Put
$\mathrm{H}=\left\{a \in \mathrm{~A}(n) \mid \sum_{r, s} \mathrm{f}(a)_{i}^{r} \mathbf{f}(a)_{j}^{s} g_{r s}(a x)=g_{i j}(x)\right.$ for all $\left.x \in \mathbf{R}^{n}, \quad, \quad \begin{array}{r}i, j=1, \ldots, n\end{array}\right\}$.
Then $H$ is an algebraic group in $\mathrm{A}(n)$ and $\operatorname{Aut}(\Omega)=\operatorname{Aff}(\Omega) \cap \mathrm{H}$. Therefore by Lemma $2.1 \quad \operatorname{Aut}_{0}(\Omega)$ coincides with the identity component of the algebraic group $N \cap H$.
q.e.d.

Proposition 2.2. - The isotropy subgroup of $\operatorname{Aut}_{0}(\Omega)$ at a point in $\Omega$ is a maximal compact subgroup of $\operatorname{Aut}_{0}(\Omega)$.

Proof. - Let $K$ be the isotropy subgroup of $\operatorname{Aut}_{0}(\Omega)$ at $p \in \Omega$. Since $\operatorname{Aff}(\Omega)$ and $H$ are closed in $A(n), \operatorname{Aut}_{0}(\Omega)$ is closed in $\mathrm{A}(n)$ and so K is closed in $\mathrm{A}(n)$. Let $\left\{x^{1}, \ldots, x^{n}\right\}$ be an affine coordinate system such that $x^{i}(p)=0$ and $g_{i j}(p)=\delta_{i j}$
where $\delta_{i j}$ is Kronecker's delta. Representing affine transformations in terms of $x^{1}, \ldots, x^{n}$ it follows $\mathrm{K} \subset \mathrm{O}(n)$ where $\mathrm{O}(n)$ is the orthogonal matrix group. Therefore $K$ is a compact subgroup of $\operatorname{Aut}_{0}(\Omega)$. Let $K^{\prime}$ be a maximal compact subgroup of $\operatorname{Aut}_{0}(\Omega)$ containing K . Then there exists a fixed point $p^{\prime} \in \Omega$ for $\mathrm{K}^{\prime}$ because $\Omega$ is a convex domain. Taking $a \in \operatorname{Aut}_{0}(\Omega)$ such that $a p^{\prime}=p$ we get $a \mathrm{~K}^{\prime} a^{-1} \subset \mathrm{~K}$. Since $a \mathrm{~K}^{\prime} a^{-1}$ is a maximal compact subgroup of Aut $_{0}(\Omega)$ we obtain $K=a K^{\prime} a^{-1}$ and so $K$ is a maximal compact subgroup of $\mathrm{Aut}_{0}(\Omega)$. q.e.d.

A subgroup T of $\mathrm{A}(n)$ is said to be triangular if the linear parts of the transformation in T can be written as upper triangular matrices with respect to some affine coordinate system.

By Proposition 2.1 and by a theorem of Vinberg [12] we get a decomposition $\mathrm{Aut}_{0}(\Omega)=\mathrm{TK}$, where T and K are a maximal connected triangular subgroup and a maximal compact subgroup of $\mathrm{Aut}_{0}(\Omega)$ respectively, and $\mathrm{T} \cap \mathrm{K}$ consists of the unit element only. Using this together with Proposition 2.2 we have

Proposition 2.3. - Let $\Omega$ be an affine homogeneous domain in $\mathbf{R}^{\boldsymbol{n}}$ with an invariant Hessian metric. Then $\Omega$ admits a simply transitive triangular subgroup of $\operatorname{Aut}(\Omega)$.

Choose a point $o \in \Omega$ and an affine coordinate system $\left\{x^{1}, \ldots, x^{n}\right\}$ such that $x^{i}(o)=0 \quad(i=1, \ldots, n)$. Let $T$ be a connected triangular subgroup of $\operatorname{Aut}(\Omega)$ acting simply transitively on $\Omega$ and $t$ the Lie algebra of $T$. For $X \in t$ we denote by $X^{*}$ the vector field on $\Omega$ induced by a one parameter subgroup of $\exp (-\mathrm{tX})$. We have then $\mathrm{X}^{*}=-\sum_{i}\left(\sum_{j} f(\mathrm{X})_{j}^{i} x^{j}+q(\mathrm{X})^{i}\right) \frac{\partial}{\partial x^{i}}$, where $f(\mathrm{X})_{j}^{i}$ and $q(\mathrm{X})^{i}$ are constants determined by X . Let V be the tangent space of $\Omega$ at $o$. Define mappings $q: \ddagger \longrightarrow \mathrm{V}$ and $f: \mathfrak{t} \longrightarrow \mathrm{gl}(\mathrm{V})$ by

$$
\begin{aligned}
q(\mathrm{X}) & =\sum_{i} q(\mathrm{X})^{i}\left(\frac{\partial}{\partial x^{i}}\right)_{0} \\
f(\mathrm{X}) q(\mathrm{Y}) & =\sum_{i, j} f(\mathrm{X})_{j}^{i} q(\mathrm{X})^{i}\left(\frac{\partial}{\partial x^{i}}\right)_{0} .
\end{aligned}
$$

Then we have
(1) $f$ is a representation of $t$ in $V$.
(2) $q$ is a linear isomorphism from $t$ onto $V$ satisfying

$$
q([\mathrm{X}, \mathrm{Y}])=f(\mathrm{X}) q(\mathrm{Y})-f(\mathrm{Y}) q(\mathrm{X}) \text { for } \mathrm{X}, \mathrm{Y} \in \mathrm{t}
$$

We now define an operation of multiplication in V by the formula

$$
\begin{equation*}
x \cdot y=f\left(q^{-1}(x)\right) y \text { for } x, y \in \mathrm{~V} \tag{3}
\end{equation*}
$$

The algebra V with this multiplication is called the algebra of the affine homogeneous domain $\Omega$ with respect to the point $o \in \Omega$ and the simply transitive connected triangular group T. Using the notation

$$
\begin{aligned}
& x \cdot y=\mathrm{L}_{x} y=\mathrm{R}_{y} x \\
& {[x \cdot y \cdot z]=x \cdot(y \cdot z)-(x \cdot y) \cdot z}
\end{aligned}
$$

from (1) (2) we get

$$
\begin{align*}
{\left[\mathrm{L}_{x}, \mathrm{~L}_{y}\right] } & =\mathrm{L}_{x \cdot y-y \cdot x}  \tag{4}\\
{[x \cdot y \cdot z] } & =[y \cdot x \cdot z]  \tag{5}\\
{\left[\mathrm{L}_{x}, \mathrm{R}_{y}\right] } & =\mathrm{R}_{x \cdot y}-\mathrm{R}_{y} \mathrm{R}_{x} \tag{6}
\end{align*}
$$

for $x, y, z \in \mathrm{~V}$. The conditions (4), (5) and (6) are mutually equivalent.

Definition 2.1 - An algebra satisfying one of the conditions (4)(5)(6) is said to be left symmetric (cf. Vinberg [13]).

Definition 2.2. - A left symmetric algebra is said to be normal if all operators $\mathrm{L}_{x}$ have only real eigenvalues (cf. [13]).

Let $\langle$,$\rangle denote the inner product on \mathrm{V}$ given by the Hessian metric. Then we have

$$
\begin{equation*}
\langle x \cdot y, z\rangle+\langle y, x \cdot z\rangle=\langle y \cdot x, z\rangle+\langle x, y \cdot z\rangle \tag{7}
\end{equation*}
$$

for all $x, y, z \in \mathrm{~V}$ (cf. [8]).

Definition 2.3. - A left symmetric algebra endowed with an inner product satisfying (7) is called a Hessian algebra.

Summing up the obtained results, we have

Proposition 2.4. - Let $\Omega$ be an affine homogeneous domain with an invariant Hessian metric. Then the algebra of $\Omega$ with respect to a point in $\Omega$ and a simply transitive connected triangular group is a normal Hessian algebra.

Conversely we shall prove that a normal Hessian algebra determines an affine homogeneous domain with an invariant Hessian metric.

Let $V$ be a normal Hessian algebra endowed with an inner product $\langle$,$\rangle . Let \left\{e_{1}, \ldots, e_{n}\right\}$ be an orthonormal basis of V with respect to $\langle$,$\rangle and \left\{x^{1}, \ldots, x^{n}\right\}$ the affine coordinate system on V given by $v=\sum_{i} x^{i}(v) e_{i}$ for all $v \in \mathrm{~V}$. We denote by $\mathrm{f}(a) \in \mathrm{GL}(\mathrm{V})$ and $\mathrm{q}(a) \in \mathrm{V}$ the linear part and the translation part of $a \in \mathrm{~A}(n)$ respectively; $a v=\mathbf{f}(a) v+\mathbf{q}(a)$. For $v \in \mathrm{~V}$ we define an infinitesimal affine transformation $\mathrm{X}_{v}^{*}$ by

$$
\begin{equation*}
\mathrm{X}_{v}^{*}=-\sum_{i, j}\left(\mathrm{~L}_{v_{j}}^{i} x^{j}+v^{i}\right) \frac{\partial}{\partial x^{i}} \tag{8}
\end{equation*}
$$

where $\mathrm{L}_{v_{j}}^{i}, \quad v^{i}$ are the components of $\mathrm{L}_{v}, v$ with respect to $\left\{e_{1}, \ldots, e_{n}\right\} ; \mathrm{L}_{v} e_{j}=\sum_{i} \mathrm{~L}_{v_{j}}^{i} e_{i}, v=\sum_{i} v^{i} e_{i}$. From (4) it follows

$$
\begin{equation*}
\left[\mathrm{X}_{v}^{*}, \mathrm{X}_{w}^{*}\right]=\mathrm{X}_{v . w-w . v}^{*} \text { for } v, w \in \mathrm{~V} \tag{9}
\end{equation*}
$$

and so $\mathfrak{t}(\mathrm{V})=\left\{\mathrm{X}_{v}^{*} \mid v \in \mathrm{~V}\right\}$ forms a Lie algebra. Let $\mathrm{T}(\mathrm{V})$ denote the connected Lie subgroup of $\mathrm{A}(n)$ generated by $\mathrm{t}(\mathrm{V})$. We denote by $\Omega(\mathrm{V})$ the open orbit of $\mathrm{T}(\mathrm{V})$ through the origin $0 ; \Omega(\mathrm{V})=\mathrm{T}(\mathrm{V}) 0$, which we call the affine homogeneous domain corresponding to V .

We first show that $\mathrm{T}(\mathrm{V})$ acts simply transitively on $\Omega(\mathrm{V})$. By (8) the isotropy subgroup $B$ of $T(V)$ at 0 is discrete. Suppose $b \in B$. Since the exponential mapping exp: $t(V) \longrightarrow T(V)$ is surjective because $T(V)$ is triangular, there exists $X_{w}^{*} \in t(V)$ such that $b=\exp X_{w}^{*}$. If we put $b^{\prime}=\exp 1 / 2 \mathrm{X}_{w}^{*}$, then we have $0=b 0=b^{\prime 2} 0=\mathbf{f}\left(b^{\prime}\right) \mathbf{q}\left(b^{\prime}\right)+\mathbf{q}\left(b^{\prime}\right)$ and so $\mathbf{f}\left(b^{\prime}\right) \mathbf{q}\left(b^{\prime}\right)=-\mathbf{q}\left(b^{\prime}\right)$. Since $f\left(b^{\prime}\right)=\exp \left(-1 / 2 L_{w}\right)$ and since $L_{w}$ is triangular, the eigenvalues of $\mathbf{f}\left(b^{\prime}\right)$ are all positive. This means $b^{\prime} 0=\mathbf{q}\left(b^{\prime}\right)=0$ and so $b^{\prime}=\exp 1 / 2 X_{w}^{*} \in B$. By the same argument we have $\exp 1 / 2^{n} X_{w}^{*} \in B$ for all non-negative integer $n$. Thus $X_{w}^{*}=0$ because B is discrete. Therefore $B$ consists of the unit element only and $T(V)$ acts simply transitively on $\Omega(\mathrm{V})$.

Now we denote by $g$ the $\mathrm{T}(\mathrm{V})$-invariant Riemannian metric on $\Omega(\mathrm{V})$ satisfying $g_{i j}(0)=\delta_{i j}$ (Kronecker's delta). It follows then

$$
\begin{equation*}
g_{i j}(a 0)=\sum_{p} \mathbf{f}\left(a^{-1}\right)_{i}^{p} f\left(a^{-1}\right)_{j}^{p} \quad \text { for } \quad a \in \mathrm{~T}(\mathrm{~V}) \tag{10}
\end{equation*}
$$

where $f(a)_{i}^{j}$ are the components of $f(a)$ with respect to $\left\{e_{1}, \ldots, e_{n}\right\}$. Denoting by $\exp t X_{v}^{*}$ the one parameter group generated by $\mathrm{X}_{v}^{*}$ we get $\left.\quad \frac{d}{d t}\right|_{t=0} f\left(\operatorname{exp~tX}{ }_{v}^{*}\right)=-\mathrm{L}_{v} \quad$ and $\left.\quad \frac{d}{d t}\right|_{t=0} \mathbf{q}\left(\operatorname{exp~tX}{ }_{v}^{*}\right)=-v$. Choose an element $a \in \mathrm{~T}(\mathrm{~V})$ and define an isomorphism $v \longrightarrow v^{\prime}$ of V by $a^{-1} \exp \mathrm{tX}_{v}^{*} a=\exp \mathrm{tX}_{v^{\prime}}^{*}$. Then we have

$$
\begin{align*}
& v^{\prime}=\mathbf{f}(a)^{-1} \mathrm{~L}_{v} \mathbf{q}(a)+\mathbf{f}(a)^{-1} v=\mathrm{L}_{v^{\prime}} \mathbf{f}(a)^{-1} \mathbf{q}(a)+\mathbf{f}(a)^{-1} v,  \tag{11}\\
& \mathrm{~L}_{v^{\prime}}=\mathbf{f}(a)^{-1} \mathrm{~L}_{v} \mathbf{f}(a) .
\end{align*}
$$

Let $D$ denote the natural flat linear connection on $\Omega(\mathrm{V})$ given by $\mathrm{D} d x^{i}=0$. Put $\mathrm{A}_{\mathrm{X}^{*}}=\mathrm{L}_{\mathrm{X}^{*}}-\mathrm{D}_{\mathrm{X}^{*}}$ where $\mathrm{L}_{\mathrm{X}^{*}}$ and $\mathrm{D}_{\mathrm{X}^{*}}$ are the Lie differentiation and the covariant differentiation by a vector field $\mathrm{X}^{*}$ respectively. We have

$$
\begin{equation*}
\left(\mathrm{A}_{\mathrm{x}_{u}^{*}} \mathrm{X}_{v}^{*}\right)_{x}=-\sum_{i}\left(\mathrm{~L}_{u} \mathrm{~L}_{v} x+\mathrm{L}_{u} v\right)^{i}\left(\frac{\partial}{\partial x^{i}}\right)_{x} \tag{12}
\end{equation*}
$$

for all $x \in \Omega(V)$. Since $A_{X_{u}^{*}}$ is a derivation of the algebra of tensor fields and maps every function into zero and since $\mathrm{L}_{\mathrm{x}^{*}} g=0$, it follows

$$
\begin{equation*}
\left(\mathrm{D}_{\mathrm{X}_{u}^{*}} g\right)\left(\mathrm{X}_{v}^{*}, \mathrm{X}_{w}^{*}\right)=g\left(\mathrm{~A}_{\mathrm{X}_{u}^{*}} \mathrm{X}_{v}^{*}, \mathrm{X}_{w}^{*}\right)+g\left(\mathrm{X}_{v}^{*}, \mathrm{~A}_{\mathrm{X}_{u}^{*}} \mathrm{X}_{w}^{*}\right) \tag{13}
\end{equation*}
$$

Using (10) (11) (12) we obtain
$g(a 0)\left(\left(\mathrm{A}_{u}^{*} \mathrm{X}_{v}^{*}\right)_{a 0},\left(\mathrm{X}_{w}^{*}\right)_{a 0}\right)$

$$
\begin{aligned}
& =\sum_{i, j, p} f\left(a^{-1}\right)_{i}^{p} \mathbf{f}\left(a^{-1}\right)_{j}^{p}\left(\mathrm{~L}_{u} \mathrm{~L}_{v} a 0+\mathrm{L}_{u} v\right)^{i}\left(\mathrm{~L}_{w} a 0+w\right)^{j} \\
& =\sum_{p}\left(\mathbf{f}\left(a^{-1}\right)\left(\mathrm{L}_{u} \mathrm{~L}_{v} \mathbf{q}(a)+\mathrm{L}_{u} v\right)\right)^{p}\left(\mathbf{f}\left(a^{-1}\right)\left(\mathrm{L}_{w} \mathbf{q}(a)+w\right)\right)^{p} \\
& =\sum_{p}\left(\mathrm{~L}_{u^{\prime}} \mathrm{L}_{v^{\prime}} \mathbf{f}(a)^{-1} \mathbf{q}(a)+\mathrm{L}_{u^{\prime}}, \mathbf{f}(a)^{-1} v\right)^{p}\left(\mathrm{~L}_{w^{\prime}}, \mathbf{f}(a)^{-1} \mathbf{q}(a)\right. \\
& =\sum_{p}\left(u^{\prime} \cdot v^{\prime}\right)^{p_{w}, p} \\
& =\left\langle u^{\prime} \cdot v^{\prime}, w^{\prime}\right\rangle .
\end{aligned}
$$

This together with (7) (13) implies

$$
\left(\mathrm{D}_{\mathrm{x}_{u}^{*}} g\right)\left(\mathrm{X}_{v}^{*}, \mathrm{X}_{w}^{*}\right)=\left(\mathrm{D}_{\mathrm{X}_{v}^{*}} g\right)\left(\mathrm{X}_{u}^{*}, \mathrm{X}_{w}^{*}\right)
$$

and so $g$ is a Hessian metric (cf. [8]).
Let $\Omega$ be an affine homogeneous domain in $\mathbf{R}^{n}$ with an invariant Hessian metric and $V$ the normal Hessian algebra of $\Omega$ with respect to $0 \in \Omega$ and a simply transitive triangular group. Identifying the tangent space V of $\Omega$ at 0 with $\mathrm{R}^{n}$ the domain $\Omega(\mathrm{V})$ corresponding to V coincides with $\Omega$. Therefore we have

Theorem 2.1. - Let V be a normal Hessian algebra. Then the domain $\Omega(\mathrm{V})$ constructed as above is an affine homogeneous domain with invariant Hessian metric. All affine homogeneous domains with invariant Hessian metric are obtained in this way.

Definition 2.4 (cf. [3]). - A normal left symmetric algebra U is called a clan if it admits a linear function $\omega$ satisfying the condition
(i) $\omega(x \cdot y)=\omega(y \cdot x)$ for all $x, y \in \mathrm{U}$,
(ii) $\omega(x \cdot x)>0$ for all $x \neq 0 \in \mathrm{U}$.

Remark. - Let U be a clan with $\omega$. If we put $\langle x, y\rangle=\omega(x \cdot y)$, then $\langle$,$\rangle is an inner product on U$ satisfying the condition (7) and so U is a normal Hessian algebra.

The following theorem is due to Vinberg [13].
Theorem 2.2. - Let V be a clan. Then the domain $\Omega(\mathrm{V})$ is an affine homogeneous convex domain not containing any full straight line. All affine homogeneous convex domains not containing any full straight line are obtained in this way.

## 3. Structure of normal Hessian algebras.

In this section we state a fundamental theorem for normal Hessian algebras. Let V be a normal Hessian algebra.

Definition 3.1. - Let W be a vector subspace of V .
(a) W is called a commutative subalgebra of V if $\mathrm{W} \cdot \mathrm{W}=\{0\}$.
(b) W is said to be an ideal of V if $\mathrm{W} \cdot \mathrm{V} \subset \mathrm{W}$ and $\mathrm{V} \cdot \mathrm{W} \subset \mathrm{W}$.

Theorem 3.1. - Let V be a normal Hessian algebra. Then V is decomposed into the semi-direct sum $\mathrm{V}=\mathrm{I}+\mathrm{U}$, where I is a commutative ideal of V and U is a subalgebra with an element $s$ satisfying the following properties:
(i) $s \cdot s=s$,
(ii) the restriction of $\mathrm{L}_{s}$ on U is diagonalizable and has eigenvalues $1,1 / 2$,
(iii) $\mathrm{R}_{s}=2 \mathrm{~L}_{s}-1$ on U ,
where 1 is the identity transformation of U . (An element $s$ in U satisfying the above conditions is called a principal idempotent of U.)

The proof of this theorem is carried out by induction on the dimension of normal Hessian algebras in an analogous way as Gindikin and Vinberg [1] [14].

For later use we prepare some lemmas.
Lemma 3.1. - Let W be an ideal of V . Then the orthogonal complement $\mathrm{W}^{\perp}$ of W in V is a subalgebra.

Proof. - Let $x, y \in \mathrm{~W}^{\perp}$ and $a \in \mathrm{~W}$. We have then

$$
\langle a, x \cdot y\rangle=-\langle x \cdot a, y\rangle+\langle a \cdot x, y\rangle+\langle x, a \cdot y\rangle=0
$$

This implies $x \cdot y \in \mathrm{~W}^{\perp}$.
q.e.d.

Lemma 3.2. - Let $u$ be a non-zero element in V and let $\mathrm{P}=\{p \in \mathrm{~V} \mid p \cdot u=0\}$. Suppose P is invariant by $\mathrm{L}_{u}$. Then for $p \in \mathrm{P}, x \in \mathrm{~V}$ we have
(i) $\mathrm{L}_{u}(p \cdot x)=\left(\mathrm{L}_{u} p\right) \cdot x+p \cdot\left(\mathrm{~L}_{u} x\right)$,
(ii) $\exp t \mathrm{~L}_{u}(p \cdot x)=\left(\exp t \mathrm{~L}_{u} p\right) \cdot\left(\exp t \mathrm{~L}_{u} x\right)$,
(iii) $\frac{d}{d t}\left\langle\exp \mathrm{tL}_{u} p, \exp \mathrm{tL}_{u} x\right\rangle=\left\langle u, \exp \mathrm{tL}_{u}(p \cdot x)\right\rangle$.

Proof.- (i) follows from

$$
u \cdot(p \cdot x)=(u \cdot p) \cdot x+p \cdot(u \cdot x)-(p \cdot u) \cdot x
$$

(ii) is a consequence of (i). Using (7) in 2 and (ii) we obtain

$$
\begin{aligned}
\frac{d}{d t}\langle\exp & \left.\mathrm{tL}_{u} p, \exp \mathrm{tL}_{u} x\right\rangle \\
& =\left\langle\mathrm{L}_{u} \exp \mathrm{tL}_{u} p, \exp \mathrm{tL}_{u} x\right\rangle+\left\langle\exp \mathrm{tL}_{u} p, \mathrm{~L}_{u} \exp \mathrm{tL}_{u} x\right\rangle \\
& =\left\langle\left(\exp \mathrm{tL}_{u} p\right) \cdot u, \exp \mathrm{tL}_{u} x\right\rangle+\left\langle u,\left(\exp \mathrm{tL}_{u} p\right) \cdot\left(\exp \mathrm{tL}_{u} x\right)\right\rangle \\
& =\left\langle u, \exp \mathrm{tL}_{u}(p \cdot x)\right\rangle .
\end{aligned}
$$

Lemma 3.3. - Let W be a subspace of V. Suppose that an element $a \neq 0 \in \mathrm{~V}$ satisfies the following conditions :
(a) $a \cdot a=\epsilon a$, where $\epsilon=0,1$,
(b) $\mathrm{L}_{a}$ and $\mathrm{R}_{a}$ leave W invariant,
(c) $a$ is orthogonal to $\mathrm{W} \cdot \mathrm{W}$.

Then we have:
(i) If $\epsilon=0, \mathrm{~L}_{a}=\mathrm{R}_{a}=0$ on W .
(ii) If $\epsilon=1$, the restriction of $\mathrm{L}_{a}$ on W is symmetric and its eigenvalues are $0,1 / 2$. Moreover $\mathrm{R}_{a}=2 \mathrm{~L}_{a}$ on W .

Proof. - From (6) in 2, (a) and (b) it follows

$$
\begin{equation*}
\left[\mathrm{L}_{a}, \mathrm{R}_{a}\right]=\epsilon \mathrm{R}_{a}-\mathrm{R}_{a}^{2} \text { on } \mathrm{W} \tag{1}
\end{equation*}
$$

By (c) we have

$$
\langle a \cdot x, y\rangle+\langle x, a \cdot y\rangle=\langle x \cdot a, y\rangle+\langle a, x \cdot y\rangle=\langle x \cdot a, y\rangle
$$

for all $x, y \in \mathrm{~W}$. This implies

$$
\begin{equation*}
\mathrm{L}_{a}+{ }^{t} \mathrm{~L}_{a}=\mathrm{R}_{a} \text { on } \mathrm{W} \tag{2}
\end{equation*}
$$

Put $\mathrm{S}=\epsilon \mathrm{R}_{a}-\mathrm{R}_{a}^{2}$. S being commutative with $\mathrm{R}_{a}$ we have $\operatorname{Tr}_{\mathrm{W}} \mathrm{S}^{2}=\operatorname{Tr}_{\mathrm{W}}\left[\mathrm{L}_{a}, \mathrm{R}_{a}\right] \mathrm{S}=\operatorname{Tr}_{\mathrm{W}}\left[\mathrm{L}_{a} \mathrm{~S}, \mathrm{R}_{a}\right]=0$. This means $\mathrm{S}=0$ on W because S is symmetric on W by (2) and so

$$
\begin{equation*}
\mathrm{R}_{a}^{2}=\epsilon \mathrm{R}_{a} \text { on } \mathrm{W},\left[\mathrm{~L}_{a}, \mathrm{R}_{a}\right]=0 \text { on } \mathrm{W} \tag{3}
\end{equation*}
$$

Suppose $\epsilon=0$. The facts that $\mathrm{R}_{a}$ is symmetric on W and that $\mathrm{R}_{a}^{2}=0$ on W imply $\mathrm{R}_{a}=0$ on W . Using this and (2), $\mathrm{L}_{a}$ is skew symmetric on W and its eigenvalues are purely imaginary. Therefore we must have $\mathrm{L}_{a}=0$ on W . Suppose $\epsilon=1$. Since $\mathrm{R}_{a}^{2}=\mathrm{R}_{a}$ on W the eigenvalues of $\mathrm{R}_{a}$ on W are 0,1 . From (2) it follows $\mathrm{L}_{a}-{ }^{t} \mathrm{~L}_{a}=2 \mathrm{~L}_{a}-\mathrm{R}_{a}$ on W . Since $\left[\mathrm{L}_{a}, \mathrm{R}_{a}\right]=0$
on W and since the eigenvalues of $\mathrm{L}_{a}, \mathrm{R}_{a}$ on W are real, the eigenvalues of $2 \mathrm{~L}_{a}-\mathrm{R}_{a}$ on W are real. On the other hand $\mathrm{L}_{a}-{ }^{t} \mathrm{~L}_{a}$ is skew symmetric and its eigenvalues are purely imaginary. Therefore we have $\mathrm{L}_{a}-{ }^{t} \mathrm{~L}_{a}=2 \mathrm{~L}_{a}-\mathrm{R}_{a}=0$ on W and so ${ }^{t} \mathrm{~L}_{a}=\mathrm{L}_{a}$ on $\mathrm{W}, \mathrm{R}_{a}=2 \mathrm{~L}_{a}$ on W . This means (ii). q.e.d.

The following lemmas $3.4^{*}-3.7^{*}$ are immediate consequences of Theorem 3.1.

Lemma 3.4.* - Let $\mathrm{U}_{\lambda}$ denote the eigenspaces of $\mathrm{L}_{s}$ on U corresponding to $\lambda$. Then we have:
(i) $\mathrm{U}=\mathrm{U}_{1}+\mathrm{U}_{1 / 2}$,

$$
\mathrm{U}_{\lambda} \cdot \mathrm{U}_{\mu} \subset \mathrm{U}_{\mu-\lambda+1}
$$

(ii) U is a clan.

Proof. - For $x \in \mathrm{U}_{\lambda}, y \in \mathrm{U}_{\mu}$ we have

$$
\begin{aligned}
& s \cdot(x \cdot y)=(s \cdot x) \cdot y+x \cdot(s \cdot y)-(x \cdot s) \cdot y \\
& \quad=\lambda x \cdot y+\mu x \cdot y-(2 \lambda-1) x \cdot y=(\mu-\lambda+1) x \cdot y
\end{aligned}
$$

and so $x \cdot y \in \mathrm{U}_{\mu-\lambda+1}$. Define a linear function $\omega$ on U by

$$
\omega(x)=\frac{1}{\lambda}\langle s, x\rangle \text { for } x \in \mathrm{U}_{\lambda}
$$

Let $x \in \mathrm{U}_{\lambda}, y \in \mathrm{U}_{\mu}$. Using

$$
\langle s \cdot x, y\rangle+\langle x, s \cdot y\rangle=\langle x \cdot s, y\rangle+\langle s, x \cdot y\rangle
$$

$\mu-\lambda+1 \neq 0$ and $x \cdot y \in \mathrm{U}_{\mu-\lambda+1}$ we get

$$
\langle x, y\rangle=\frac{1}{\mu-\lambda+1}\langle s, x \cdot y\rangle=\omega(x \cdot y)
$$

Thus we have $\langle x, y\rangle=\omega(x \cdot y)$ for all $x, y \in \mathrm{U}$. Therefore U is a clan.
q.e.d.

Lemma 3.5.* - (i) The restriction of $\mathrm{L}_{s}$ on I is symmetric and its eigenvalues are $0,1 / 2$.
(ii) Let $\mathrm{I}_{\lambda}$ denote the eigenspace of $\mathrm{L}_{s}$ on I corresponding to $\lambda$. Then we have $\mathrm{I}=\mathrm{I}_{0}+\mathrm{I}_{1 / 2}$,

$$
\mathrm{U}_{\lambda} \cdot \mathrm{I}_{\mu} \subset \mathrm{I}_{\mu-\lambda+1}, \quad \mathrm{I}_{\lambda} \cdot \mathrm{U}_{\mu} \subset \mathrm{I}_{\mu-\lambda}
$$

(iii) $\mathrm{R}_{s}=2 \mathrm{~L}_{s}$ on I .

Proof. - Since I is a commutative ideal of V and since $s \cdot s=s$, applying Lemma 3.3 it follows that the restriction of $\mathrm{L}_{s}$ on I is symmetric and its eigenvalues are $0,1 / 2$ and moreover $\mathrm{R}_{s}=2 \mathrm{~L}_{s}$ on I . Let $x \in \mathrm{U}_{\lambda}, a \in \mathrm{I}_{\mu}$. By Theorem 3.1 (iii) we obtain

$$
\begin{aligned}
s \cdot(x \cdot a) & =(s \cdot x) \cdot a+x \cdot(s \cdot a)-(x \cdot s) \cdot a \\
& =\lambda x \cdot a+\mu x \cdot a-(2 \lambda-1) x \cdot a=(\mu-\lambda+1) x \cdot a
\end{aligned}
$$

and $x \cdot a \in \mathrm{I}_{\mu-\lambda+1}$. Let $a \in \mathrm{I}_{\lambda}, x \in \mathrm{U}_{\mu}$. By (iii) we have

$$
\begin{aligned}
s \cdot(a \cdot x) & =(s \cdot a) \cdot x+a \cdot(s \cdot x)-(a \cdot s) \cdot x \\
& =\lambda a \cdot x+\mu a \cdot x-2 \lambda a \cdot x=(\mu-\lambda) a \cdot x
\end{aligned}
$$

and so $a \cdot x \in \mathrm{I}_{\mu-\lambda}$.
q.e.d.

Lemma 3.6*. - The commutative ideal I of V is characterized by the set of all points $x \in \mathrm{~V}$ such that $x \cdot x=0$.

Proof. - Suppose $x \cdot x=0$. If $x=a+y$ where $a \in \mathrm{I}$ and $y \in \mathrm{U}$, we have $0=x \cdot x=a \cdot y+y \cdot a+y \cdot y$ and so $y \cdot y=0$. By Lemma 3.4* (ii) there exists a linear function $\omega$ on U satisfying the conditions in Definition 2.4. Since $\omega(y \cdot y)=0$, we have $y=0$ and $x=a \in \mathrm{I}$. q.e.d.

Lemma 3.7*. - The subspaces $\mathrm{I}_{0}, \mathrm{I}_{1 / 2}$ and U are mutually orthogonal with respect to $\langle$,$\rangle .$

Proof. - By Lemma 3.5* (i) $\mathrm{I}_{0}$ and $\mathrm{I}_{1 / 2}$ are orthogonal. For $a \in \mathrm{I}_{\lambda}$ we have
$0=\langle s \cdot a, s\rangle+\langle a, s \cdot s\rangle-\langle a \cdot s, s\rangle-\langle s, a \cdot s\rangle=(-3 \lambda+1)\langle a, s\rangle$
and so $\langle a, s\rangle=0$ because $\lambda=0,1 / 2$. This implies $s$ and I are orthogonal. Applying this, for $a \in \mathrm{I}_{\lambda}, x \in \mathrm{U}_{\mu}$ we obtain

$$
0=\langle s \cdot a, x\rangle+\langle a, s \cdot x\rangle-\langle a \cdot s, x\rangle-\langle s, a \cdot x\rangle=(\mu-\lambda)\langle a, x\rangle
$$

and $0=\langle s \cdot x, a\rangle+\langle x, s \cdot a\rangle-\langle x \cdot s, a\rangle-\langle s, x \cdot a\rangle$

$$
=(\lambda-\mu+1)\langle a, x\rangle
$$

This shows $\langle a, x\rangle=0$. Therefore $I$ and $U$ are orthogonal. q.e.d.

## 4. The case $u \cdot u=u$.

Since V is a normal left symmetric algebra, by Lie's Theorem there exists an element $u \neq 0 \in \mathrm{~V}$ such that $x \cdot u=\kappa(x) u$ for all $x \in \mathrm{~V}$, where $\kappa$ is a linear function on V . Multiplying $u$ by non-zero scalar (if necessary) the following two cases are possible ;

$$
\begin{aligned}
& u \cdot u=u, \\
& u \cdot u=0 .
\end{aligned}
$$

In this section we consider the case $u \cdot u=u$ and prove the following.

Proposition 4.1. - Suppose $u \cdot u=u$. Then the operator $\mathrm{L}_{u}$ is diagonalizable and has eigenvalues $0,1 / 2,1$. Denoting by $\mathrm{V}_{\lambda}$ the eigenspace of $\mathrm{L}_{u}$ corresponding to $\lambda$ we have:
(i) $\mathrm{V}=\mathrm{V}_{1}+\mathrm{V}_{1 / 2}+\mathrm{V}_{0}$ (orthogonal decomposition).
(ii) $\mathrm{V}_{1}=\{u\}$.
(iii) $u \cdot p=\frac{1}{2} p, p \cdot u=0 \quad$ for $p \in \mathrm{~V}_{1 / 2}$.
(iv) $u \cdot q=0, q \cdot u=0 \quad$ for $\quad q \in \mathrm{~V}_{0}$.
(v) $\mathrm{V}_{0} \cdot \mathrm{~V}_{1 / 2} \subset \mathrm{~V}_{1 / 2}, \quad \mathrm{~V}_{1 / 2} \cdot \mathrm{~V}_{0} \subset \mathrm{~V}_{1 / 2}$,
$\mathrm{V}_{0} \cdot \mathrm{~V}_{0} \subset \mathrm{~V}_{0}, \quad \mathrm{~V}_{1 / 2} \cdot \mathrm{~V}_{1 / 2} \subset \mathrm{~V}_{1}$.
In particular $\mathrm{V}_{1}+\mathrm{V}_{1 / 2}$ is an ideal of V with principal idempotent $u$ and $\mathrm{V}_{0}$ is a subalgebra.

Let P denote the kernel of $\mathrm{R}_{u}$;

$$
\begin{equation*}
\mathbf{P}=\{p \in \mathrm{~V} \mid p \cdot u=0\} \tag{1}
\end{equation*}
$$

Then we have

$$
\begin{align*}
& \mathrm{L}_{u} \mathrm{P} \subset \mathrm{P},  \tag{2}\\
& \mathrm{~V}=\{u\}+\mathrm{P} . \tag{3}
\end{align*}
$$

Indeed for $p \in \mathrm{P}$ we have

$$
(u \cdot p) \cdot u=u \cdot(p \cdot u)+(p \cdot u) \cdot u-p \cdot(u \cdot u)=0
$$

which implies (2). (3) follows from $x-\kappa(x) u \in \mathrm{P}$ for all $x \in \mathrm{~V}$.
Lemma 4.1. - The restriction of $\mathrm{L}_{u}$ on P is diagonalizable and has eigenvalues $0,1 / 2$.

Proof. - By Lemma 3.2 for $p \in \mathrm{P}$ we have

$$
\frac{d}{d t}\left\langle\exp \mathrm{LL}_{u} p, \exp t \mathrm{~L}_{u} u\right\rangle=\left\langle u, \exp \mathrm{tL}_{u}(p \cdot u)\right\rangle=0
$$

and so

$$
\begin{equation*}
\left\langle\exp \mathrm{tL}_{u} p, u\right\rangle=a e^{-t} \tag{4}
\end{equation*}
$$

where $a$ is a constant determined by $p$ not depending on $t$. Using this for $x=c u+p \in \mathrm{~V}(c \in \mathbf{R}, p \in \mathrm{P})$ we obtain

$$
\begin{align*}
\left\langle u, \exp \mathrm{tL}_{u} x\right\rangle & =\left\langle u, c e^{t} u+\exp \mathrm{LL}_{u} p\right\rangle \\
& =\left\langle u, \exp \mathrm{tL}_{u} p\right\rangle+c\langle u, u\rangle e^{t}=a e^{-t}+b e^{t} \tag{5}
\end{align*}
$$

where $a, b$ are constants determined by $x$ not depending on $t$. Applying Lemma 3.2 and (5) we have for $p, q \in \mathrm{P}$

$$
\frac{d}{d t}\left\langle\exp \mathrm{tL}_{u} p, \exp \mathrm{tL}_{u} q\right\rangle=\left\langle u, \exp \mathrm{tL}_{u}(p \cdot q)\right\rangle=a e^{-t}+b e^{t}
$$

and consequently

$$
\begin{equation*}
\left\langle\exp \mathrm{tL}_{u} p, \exp \mathrm{tL}_{u} q\right\rangle=-a e^{-t}+b e^{t}+c, \tag{6}
\end{equation*}
$$

where $a, b$ and $c$ are constants determined by $p, q$ not depending on $t$. From (6) it follows that $\mathrm{L}_{u}$ is diagonalizable on P . Indeed, if $L_{u}$ is not diagonalizable on $P$ there exist non-zero elements $p, q \in \mathrm{P}$ such that $\mathrm{L}_{u} p=\lambda p, \mathrm{~L}_{u} q=\lambda q+p$. We have then

$$
\begin{aligned}
\left\langle\exp \mathrm{tL}_{u} p, \exp \mathrm{tL}_{u} q\right\rangle & =\left\langle e^{\lambda t} p, e^{\lambda t} q+t e^{\lambda t} p\right\rangle \\
& =t e^{2 \lambda t}\langle p, p\rangle+e^{2 \lambda t}\langle p, q\rangle
\end{aligned}
$$

which contradicts to (6). Let $\lambda$ be an eigenvalue of $L_{u}$ on $P$ and $p \neq 0 \in \mathrm{P}$ an eigenvector corresponding to $\lambda$. It follows then

$$
\frac{d}{d t}\left\langle\exp \mathrm{tL}_{u} p, \exp \mathrm{tL}_{u} p\right\rangle=2 \lambda\langle p, p\rangle e^{2 \lambda t}
$$

On the other hand (6) implies

$$
\frac{d}{d t}\left\langle\exp \mathrm{tL}_{u} p, \quad \exp \mathrm{tL}_{u} p\right\rangle=a e^{-t}+b e^{t}
$$

Therefore we obtain

$$
\begin{equation*}
2 \lambda\langle p, p\rangle e^{2 \lambda t}=a e^{-t}+b e^{t} \tag{7}
\end{equation*}
$$

consequently $\lambda=0,1 / 2,-1 / 2$. By (4) we get $\langle p, u\rangle e^{(\lambda+1) t}=a$, so $\langle p, u\rangle=0$ and $a=0$ because $\lambda+1 \neq 0$. Thus we have

$$
\begin{gather*}
\langle p, u\rangle=0 \text { for all } p \in \mathrm{P} \\
\left\langle u, \exp \mathrm{tL}_{u} x\right\rangle=b e^{t} \text { for } x \in \mathrm{~V}, \\
2 \lambda\langle p, p\rangle e^{2 \lambda t}=b e^{t}
\end{gather*}
$$

(7') shows $\lambda=0,1 / 2$.
q.e.d.

Let $P_{\lambda}$ denote the eigenspace of $L_{u}$ in $P$ corresponding to $\lambda$. From Lemma 4.1 and (3) it follows

$$
\begin{equation*}
\mathrm{V}=\mathrm{V}_{1}+\mathrm{V}_{1 / 2}+\mathrm{V}_{0} \tag{8}
\end{equation*}
$$

where $\mathrm{V}_{1}=\{u\}, \mathrm{V}_{1 / 2}=\mathrm{P}_{1 / 2}$ and $\mathrm{V}_{0}=\mathrm{P}_{0}$.
Lemma 4.2. - The decomposition (8) is orthogonal and we have $\mathrm{P}_{\lambda} \cdot \mathrm{P}_{\mu} \subset \mathrm{V}_{\lambda+\mu}$.

Proof. - For $p \in \mathrm{P}_{\lambda}$ and $q \in \mathrm{P}_{\mu}$ we have

$$
u \cdot(p \cdot q)=(u \cdot p) \cdot q+p \cdot(u \cdot q)-(p \cdot u) \cdot q=(\lambda+\mu) p \cdot q
$$

This implies $P_{\lambda} \cdot P_{\mu} \subset V_{\lambda+\mu}$. The orthogonality of $\{u\}$ and $P$ follows from (4'). Applying this for $p \in \mathrm{P}_{1 / 2}$ and $q \in \mathrm{P}_{0}$ we obtain $1 / 2\langle p, q\rangle=\langle u \cdot p, q\rangle=-\langle p, u \cdot q\rangle+\langle p \cdot u, q\rangle+\langle u, p \cdot q\rangle=0$ because $p \cdot q \in \mathrm{P}_{1 / 2}$. Thus $\mathrm{P}_{1 / 2}$ and $\mathrm{P}_{0}$ are orthogonal. q.e.d.

The assertion of Proposition 4.1 follows from Lemma 4.2 and (8).

## 5. The case $u \cdot u=0$.

The purpose of this section is to prove the following.

Proposition 5.1. - Suppose $u \cdot u=0$. Then there exists $a$ commutative ideal of V containing $u$.

Lemma 5.1. $-\mathrm{L}_{u}^{2}=0$.
Proof. - Let P denote the kernel of $\mathrm{R}_{u} ; \mathrm{P}=\{p \in \mathrm{~V} \mid p \cdot u=0\}$. Then we have

$$
\begin{equation*}
\mathrm{L}_{u} \mathrm{~V} \subset \mathrm{P} \tag{1}
\end{equation*}
$$

because $(u \cdot x) \cdot u=u \cdot(x \cdot u)+(x \cdot u) \cdot u-x \cdot(u \cdot u)=0$ for all $x \in \mathrm{~V}$. For $p \in \mathrm{P}, x \in \mathrm{~V}$ it follows from (1) and Lemma 3.2

$$
\begin{aligned}
& \frac{d^{3}}{d t^{3}}\left\langle\exp \mathrm{tL}_{u} p, \exp \mathrm{tL}_{u} x\right\rangle \\
&=\frac{d^{2}}{d t^{2}}\left\langle u, \exp \mathrm{tL}_{u}(p \cdot x)\right\rangle=\left\langle u, u \cdot p^{\prime}\right\rangle \\
&=-\left\langle p^{\prime}, u \cdot u\right\rangle+\left\langle p^{\prime} \cdot u, u\right\rangle+\left\langle u, p^{\prime} \cdot u\right\rangle=0
\end{aligned}
$$

where $p^{\prime}=\mathrm{L}_{u} \exp \operatorname{tL}_{u}(p \cdot x) \in \mathrm{P}$, and consequently

$$
\begin{equation*}
\left\langle\exp \mathrm{tL}_{u} p, \exp t \mathrm{~L}_{u} x\right\rangle=a t^{2}+b t+c \tag{2}
\end{equation*}
$$

where $a, b, c$ are constants independent of $t$. Let $\lambda$ be an eigenvalue of $\mathrm{L}_{u}$ on P and $p \neq 0 \in \mathrm{P}$ an eigenvector corresponding to $\lambda$. By (2) we get $e^{2 \lambda t}\langle p, p\rangle=a t^{2}+b t+c$, and so $\lambda=0$. This together with (1) implies that the eigenvalues of $L_{u}$ are equal to 0 . Assume $\mathrm{L}_{u}^{2} \neq 0$. Then there exist non-zero elements $x, y, z \in \mathrm{~V}$ such that $u \cdot x=0, u \cdot y=x, u \cdot z=y$. From this we have $\exp \mathrm{tL}_{u} y=y+t x, \exp \mathrm{tL}_{u} z=z+t y+\frac{t^{2}}{2} x$. Since $y=u \cdot z \in \mathrm{P}$, applying (2) we obtain $\left\langle y+t x, z+t y+\frac{t^{2}}{2} x\right\rangle=a t^{2}+b t+c$. This is a contradiction because $\langle x, x\rangle \neq 0$. Thus we have $\mathrm{L}_{u}^{2}=0$. q.e.d.

Using $L_{u}^{2}=0$ we define a filtration of $V$. Consider the subspaces of V

$$
\begin{aligned}
& \mathrm{V}^{(-1)}=\mathrm{V} \\
& \mathrm{~V}^{(0)}=\left\{x \in \mathrm{~V} \mid \mathrm{L}_{u} x \in\{u\}\right\} \\
& \mathrm{V}^{(1)}=\mathrm{L}_{u} \mathrm{~V}+\{u\} \\
& \mathrm{V}^{(2)}=\{u\}
\end{aligned}
$$

Then we have

Lemma 5.2. - The subspaces $\mathrm{V}^{(i)}$ form a filtration of the algebra V;
(i) $V^{(-1)} \supset V^{(0)} \supset V^{(1)} \supset V^{(2)}$,
(ii) $\mathrm{V}^{(i)} \cdot \mathrm{V}^{(j)} \subset \mathrm{V}^{(i+j)}$.

Moreover we have
(iii) $\mathrm{V}^{(1)} \cdot \mathrm{V}^{(1)}=\{0\}$.

Proof. - (i) follows from $u \cdot u=0$ and $\mathrm{L}_{u}^{2}=0$. Note that

$$
\begin{equation*}
(u \cdot x) \cdot(u \cdot y)=0 \quad \text { for all } \quad x, y \in \mathrm{~V} . \tag{3}
\end{equation*}
$$

In fact for $x, y \in \mathrm{~V}$ we have

$$
\begin{aligned}
& 0=u \cdot(u \cdot(x \cdot y))=u \cdot((u \cdot x) \cdot y+x \cdot(u \cdot y)-(x \cdot u) \cdot y) \\
&=u \cdot((u \cdot x) \cdot y)+u \cdot(x \cdot(u \cdot y))-\kappa(x) u \cdot(u \cdot y)=(u \cdot(u \cdot x)) \cdot y \\
&+(u \cdot x) \cdot(u \cdot y)-((u \cdot x) \cdot u) \cdot y+(u \cdot x) \cdot(u \cdot y)+x \cdot(u \cdot(u \cdot y)) \\
&-(x \cdot u) \cdot(u \cdot y)=2(u \cdot x) \cdot(u \cdot x)
\end{aligned}
$$

because $\mathrm{L}_{u}^{2}=0, \mathrm{~V} \cdot u \subset\{u\}$ and $\mathrm{L}_{u} \mathrm{~V} \subset \mathrm{P}$. Let

$$
u \cdot x+\lambda u, u \cdot y+\mu u \in \mathrm{~V}^{(1)}(x, y \in \mathrm{~V}, \lambda, \mu \in \mathbf{R}) .
$$

Using (1) and (3) we get

$$
\begin{aligned}
(u \cdot x+\lambda u) \cdot(u \cdot y+\mu u)= & (u \cdot x) \cdot(u \cdot y)+\mu(u \cdot x) \cdot u \\
& +\lambda u \cdot(u \cdot y)+\lambda \mu u \cdot u \\
= & 0 .
\end{aligned}
$$

This implies (iii). Let $x \in \mathrm{~V}^{(0)}, u \cdot y+\mu u \in \mathrm{~V}^{(1)}(y \in \mathrm{~V}, \mu \in \mathbf{R})$. We have then $u \cdot x=\nu u(\nu \in \mathbf{R})$ and

$$
\begin{aligned}
x \cdot(u \cdot y+\mu u)= & x \cdot(u \cdot y)+\mu x \cdot u=(x \cdot u) \cdot y+u \cdot(x \cdot y) \\
& -(u \cdot x) \cdot y+\mu x \cdot u \\
= & \kappa(x) u \cdot y+u \cdot(x \cdot y)-\nu u \cdot y+\mu \kappa(x) u \in \mathrm{~V}^{(1)} .
\end{aligned}
$$

In the same way $(u \cdot y+\mu u) \cdot x \in \mathrm{~V}^{(1)}$. Therefore we have

$$
\begin{equation*}
\mathrm{V}^{(0)} \cdot \mathrm{V}^{(1)} \subset \mathrm{V}^{(1)}, \quad \mathrm{V}^{(1)} \cdot \mathrm{V}^{(0)} \subset \mathrm{V}^{(1)} \tag{4}
\end{equation*}
$$

Let $u \cdot x+\mu u \in \mathrm{~V}^{(1)}(x \in \mathrm{~V}, \mu \in \mathbf{R})$ and $y \in \mathrm{~V}^{(-1)}$. By (iii) we have

$$
\begin{aligned}
& u \cdot((u \cdot x+\mu u) \cdot y)=u \cdot((u \cdot x) \cdot y)+\mu u \cdot(u \cdot y)=(u \cdot(u \cdot x)) \cdot y \\
&+(u \cdot x) \cdot(u \cdot y)-((u \cdot x) \cdot u) \cdot y+\mu u \cdot(u \cdot y)=0 \\
& \text { and } \begin{aligned}
u \cdot(y \cdot(u \cdot x & +\mu u))=u \cdot(y \cdot(u \cdot x))+\mu u \cdot(y \cdot u) \\
& =(u \cdot y) \cdot(u \cdot x)+y \cdot(u \cdot(u \cdot x))-(y \cdot u) \cdot(u \cdot x) \\
& =0 .
\end{aligned} \quad+\mu u \cdot(y \cdot u)
\end{aligned}
$$

This implies

$$
\begin{equation*}
\mathrm{V}^{(1)} \cdot \mathrm{V}^{(-1)} \subset \mathrm{V}^{(0)}, \mathrm{V}^{(-1)} \cdot \mathrm{V}^{(1)} \subset \mathrm{V}^{(0)} \tag{5}
\end{equation*}
$$

Let $x, y \in \mathrm{~V}^{(0)}$. We have then $u \cdot x=\mu u, u \cdot y=\nu u$ and so $u \cdot(x \cdot y)=(u \cdot x) \cdot y+x \cdot(u \cdot y)-(x \cdot u) \cdot y=\mu \nu u$

$$
+\nu \kappa(x) u-\kappa(x) \nu u=\mu \nu u .
$$

This means

$$
\begin{equation*}
\mathrm{V}^{(0)} \cdot \mathrm{V}^{(0)} \subset \mathrm{V}^{(0)} \tag{6}
\end{equation*}
$$

The other relations $\mathrm{V}^{(i)} \cdot \mathrm{V}^{(j)} \subset \mathrm{V}^{(i+j)}$ are trivial. q.e.d.

If $\mathrm{V}^{(0)}=\mathrm{V}$, then $\mathrm{V}^{(2)}=\{u\}$ is a commutative ideal of V and consequently Proposition 5.1 is proved. From now on we assume $\mathrm{V}^{(0)} \neq \mathrm{V}$. Since $\mathrm{V}^{(0)}$ is a subalgebra of dimension less than $\operatorname{dim} \mathrm{V}$, by the inductive hypothesis we have $\mathrm{V}^{(0)}=\mathrm{I}+\mathrm{U}$, where I is a commutative ideal of $\mathrm{V}^{(0)}$ and U is a subalgebra with a principal idempotent $s$.

Lemma 5.3. $-\mathrm{V}^{(1)} \subset \mathrm{I}$.
Proof. - According to Lemma 3.6* it follows

$$
\mathrm{I}=\left\{x \in \mathrm{~V}^{(0)} \mid x \cdot x=0\right\}
$$

This and $\mathrm{V}^{(1)} \cdot \mathrm{V}^{(1)}=\{0\}$ imply $\mathrm{V}^{(1)} \subset \mathrm{I}$.
q.e.d.

Lemma 5.4. - $\mathrm{V} \cdot \mathrm{I} \subset \mathrm{V}^{(0)}, \mathrm{I} \cdot \mathrm{V} \subset \mathrm{V}^{(0)}$.
Proof. - Let $x \in \mathrm{~V}$ and $a \in \mathrm{I}$. Since I is commutative and since $u, u \cdot x, x \cdot u \in \mathrm{I}$ by Lemma 5.2 and 5.3 , we have

$$
u \cdot(x \cdot a)=(u \cdot x) \cdot a+x \cdot(u \cdot a)-(x \cdot u) \cdot a=0
$$

and

$$
u \cdot(a \cdot x)=(u \cdot a) \cdot x+a \cdot(u \cdot x)-(a \cdot u) \cdot x=0
$$

This means $x \cdot a, a \cdot x \in \mathrm{~V}^{(0)}$.
q.e.d.

If $\mathrm{I}=\mathrm{V}^{(0)}$, Lemma 5.4 implies that I is a commutative ideal of V containing $u$ and Proposition 5.1 is proved. Henceforth we assume $I \neq V^{(0)}$, i.e., $U \neq\{0\}$.

Let $s$ be a principal idempotent of $U$. Since $V^{(1)} \subset I$ and since $\mathrm{V}^{(1)}$ is invariant by $\mathrm{L}_{s}$ and $\mathrm{R}_{s}$, by Lemma 3.3 we have:

The restriction of $L_{s}$ on $V^{(1)}$ is symmetric and its eigenvalues are $0,1 / 2$. Therefore denoting by $\mathrm{V}_{\lambda}^{(1)}$ the eigenspace of $\mathrm{L}_{s}$ corresponding to $\lambda$ we obtain the orthogonal decomposition

$$
\begin{align*}
& \mathrm{V}^{(1)}=\mathrm{V}_{0}^{(1)}+\mathrm{V}_{1 / 2}^{(1)}  \tag{7}\\
& \mathrm{R}_{s}=2 \mathrm{~L}_{s} \quad \text { on } \quad \mathrm{V}^{(1)} \tag{8}
\end{align*}
$$

We set $s \cdot u=\alpha u$. From (8) it follows $u \cdot s=2 s \cdot u=2 \alpha u$. Thus

$$
\begin{align*}
& \mathrm{L}_{s} u=\alpha u, \\
& \mathrm{R}_{s} u=2 \alpha u, \text { where } \alpha=0,1 / 2 \tag{9}
\end{align*}
$$

Consider the graded algebra $\overline{\mathrm{V}}$ associated to the filtered algebra $\mathrm{V}: \overline{\mathrm{V}}=\overline{\mathrm{V}}^{(-1)}+\overline{\mathrm{V}}^{(0)}+\overline{\mathrm{V}}^{(1)}+\overline{\mathrm{V}}^{(2)}$, where $\overline{\mathrm{V}}^{(i)}=\mathrm{V}^{(i)} / \mathrm{V}^{(i+1)}$ $(-1 \leqslant i \leqslant 1)$ and $\overline{\mathrm{V}}^{(2)}=\mathrm{V}^{(2)}$. For $x \in \mathrm{~V}^{(i)}$ we denote by $\bar{x}$ the element in $\overline{\mathrm{V}}^{(i)}$ corresponding to $x$ and by $\mathrm{L}_{\bar{x}}$ (resp. $\mathrm{R}_{\bar{x}}$ ) the left (resp. right) multiplication by $\bar{x}$.

Lemma 5.5. - (i) The mapping $\mathrm{L}_{\bar{u}}: \overline{\mathrm{V}}^{(-1)} \longrightarrow \overline{\mathrm{V}}^{(1)}$ is an isomorphism.
(ii) $\mathrm{L}_{\bar{s}} \mathrm{~L}_{\bar{u}}=\mathrm{L}_{\bar{u}}\left(\mathrm{~L}_{\bar{s}}-\alpha\right)$ on $\overline{\mathrm{V}}^{(-1)}$. In particular the restriction of $\mathrm{L}_{\bar{s}}$ on $\overline{\mathrm{V}}^{(-1)}$ is diagonalizable and its eigenvalues are $\alpha$, $\alpha+1 / 2$.
(iii) $\mathrm{R}_{\bar{s}} \mathrm{~L}_{\bar{u}}=\mathrm{L}_{\bar{u}} \mathrm{R}_{\bar{s}}$ on $\overline{\mathrm{V}}^{(-1)}$.

Proof. - The mapping $\mathrm{L}_{\bar{u}}: \overline{\mathrm{V}}^{(-1)} \longrightarrow \overline{\mathrm{V}}^{(1)}$ is surjective because $\overline{\mathrm{V}}^{(1)}=\mathrm{L}_{u} \mathrm{~V}+\{u\} /\{u\}$. Suppose $\mathrm{L}_{\bar{u}} \bar{x}=0\left(x \in \mathrm{~V}^{(-1)}\right)$. Then it follows $u \cdot x \in\{u\}$, consequently $x \in \mathrm{~V}^{(0)}$ and $\bar{x}=0$. Thus (i) is proved. By (9) we have

$$
\begin{aligned}
\mathrm{L}_{\bar{s}} \mathrm{~L}_{\bar{u}} \bar{x}=\overline{s \cdot(u \cdot x)}=\overline{(s \cdot u) \cdot x} & +\overline{u \cdot(s \cdot x)}-\overline{(u \cdot s) \cdot x} \\
& =\overline{u \cdot(s \cdot x)}-\overline{\alpha u \cdot x}=\mathrm{L}_{\bar{u}}\left(\mathrm{~L}_{\bar{s}}-\alpha\right) \bar{x}
\end{aligned}
$$

for all $x \in \mathrm{~V}^{(-1)}$, which implies $\mathrm{L}_{\bar{s}} \mathrm{~L}_{\bar{u}}=\mathrm{L}_{\bar{u}}\left(\mathrm{~L}_{\bar{s}}-\alpha\right)$ on $\overline{\mathrm{V}}^{(-1)}$. Using this together with (7) the restriction of $\mathrm{L}_{\bar{s}}$ on $\overline{\mathrm{V}}^{(-1)}$ is diagonalizable and has eigenvalues $\alpha, \alpha+1 / 2$. This shows (ii). By (9) we obtain

$$
\begin{aligned}
& \mathrm{R}_{\bar{s}} \mathrm{~L}_{\bar{u}} \bar{x}=\overline{(u \cdot x) \cdot s}=\overline{u \cdot(x \cdot s)}+\overline{(x \cdot u) \cdot s}-\overline{x \cdot(u \cdot s)}=\overline{u \cdot(x \cdot s)} \\
& \quad+\kappa(x) \overline{u \cdot s}-2 \overline{\alpha x \cdot u}=\overline{u \cdot(x \cdot s)}=\mathrm{L}_{\bar{u}} \mathrm{R}_{\bar{s}} \bar{x} \text { for all } x \in \mathrm{~V}^{(-1)}
\end{aligned}
$$

which means (iii). q.e.d.

According to Lemma 3.5*, (7) and Lemma 5.5 the operator $\underline{L}_{\bar{s}}$ leaves each subspace $\overline{\mathrm{V}}^{(i)}$ invariant and is diagonalizable on $\overline{\mathrm{V}}^{(i)}$. We denote by $\overline{\mathrm{V}}_{\lambda}^{(i)}$ the eigenspace of $\mathrm{L}_{\bar{s}}$ in $\overline{\mathrm{V}}^{(i)}$ corresponding to $\lambda \in R$.

Lemma 5.6. - Let $\bar{a} \in \overline{\mathrm{~V}}_{\lambda}^{(-1)}$. Then we have
(i) $\mathrm{L}_{\bar{s}} \bar{a}=\lambda \bar{a}$,
(ii) $\mathrm{R}_{\bar{s}} \bar{a}=2(\lambda-\alpha) \bar{a}$.

Proof. - Using Lemma 5.4 and (8) we obtain

$$
\begin{aligned}
\mathrm{L}_{\bar{u}} \mathrm{R}_{\bar{s}} \bar{a}=\mathrm{R}_{\bar{s}} \mathrm{~L}_{\bar{u}} \bar{a}=\overline{\mathrm{R}_{s} \mathrm{~L}_{u} a} & =\overline{2 \mathrm{~L}_{s} \mathrm{~L}_{u} a}=2 \mathrm{~L}_{\bar{s}} \mathrm{~L}_{\bar{u}} \bar{a} \\
& =2 \mathrm{~L}_{\bar{u}}\left(\mathrm{~L}_{\bar{s}}-\alpha\right) \bar{a}=\mathrm{L}_{\bar{u}}(2(\lambda-\alpha) \bar{a}) .
\end{aligned}
$$

This implies $\mathrm{R}_{\bar{s}} \bar{a}=2(\lambda-\alpha) \bar{a}$ because $\mathrm{L}_{\bar{u}}: \overline{\mathrm{V}}^{(-1)} \longrightarrow \overline{\mathrm{V}}^{(1)}$ is an isomorphism.
q.e.d.

For simplicity we denote by $a^{\prime} \in \mathrm{V}^{(1)}$ the element $u \cdot a$ where $a \in \mathrm{~V}^{(-1)}$.

Lemma 5.7. -
(i) If $\bar{a} \in \mathrm{~V}_{\lambda}^{(-1)}$, then $\bar{a}^{\prime} \in \overline{\mathrm{V}}_{\lambda-\alpha}^{(1)}$.
(ii) Let $\bar{a} \in \mathrm{~V}_{\lambda}^{(-1)}, \bar{b} \in \overline{\mathrm{~V}}_{\mu}^{(-1)}$. Then we have

$$
\bar{a}^{\prime} \cdot \bar{b}, \bar{a} \cdot \bar{b}^{\prime} \in \overline{\mathrm{V}}_{-\lambda+\mu+\alpha}^{(0)} .
$$

Proof. - From Lemma 5.5 (ii) it follows

$$
\mathrm{L}_{\bar{s}} \bar{a}^{\prime}=\mathrm{L}_{\bar{s}} \mathrm{~L}_{\bar{u}} \bar{a}=\mathrm{L}_{\bar{u}}\left(\mathrm{~L}_{\bar{s}}-\alpha\right) \bar{a}=(\lambda-\alpha) \mathrm{L}_{\bar{u}} \bar{a}=(\lambda-\alpha) \bar{a}^{\prime},
$$

which implies (i). Using (i), (8) and Lemma 5.6 (ii) we obtain

$$
\begin{aligned}
& \bar{s} \cdot\left(\bar{a}^{\prime} \cdot \bar{b}\right)=\left(\bar{s} \cdot \bar{a}^{\prime}\right) \cdot \bar{b}+\bar{a}^{\prime} \cdot(\bar{s} \cdot \bar{b})-\left(\bar{a}^{\prime} \cdot \bar{s}\right) \cdot \bar{b}=(\lambda-\alpha) \bar{a}^{\prime} \cdot \bar{b} \\
&+\mu \bar{a}^{\prime} \cdot \bar{b}-2(\lambda-\alpha) \bar{a}^{\prime} \cdot \bar{b}=(-\lambda+\mu+\alpha) \bar{a}^{\prime} \cdot \bar{b}
\end{aligned}
$$

and

$$
\begin{aligned}
\bar{s} \cdot\left(\bar{a} \cdot \bar{b}^{\prime}\right)= & (\bar{s} \cdot \bar{a}) \cdot \bar{b}^{\prime}+\bar{a} \cdot\left(\bar{s} \cdot \bar{b}^{\prime}\right)-(\bar{a} \cdot \bar{s}) \cdot \bar{b}^{\prime}=\lambda \bar{a} \cdot \bar{b}^{\prime} \\
& +(\mu-\alpha) \bar{a} \cdot \bar{b}^{\prime}-2(\lambda-\alpha) \bar{a} \cdot \overline{b^{\prime}}=(-\lambda+\mu+\alpha) \bar{a} \cdot \bar{b}^{\prime} .
\end{aligned}
$$

This shows (ii). q.e.d.

According to Lemma 3.5* and Lemma 5.3 we get

$$
\begin{aligned}
\mathrm{V}_{\lambda}^{(0)} \cdot \mathrm{V}_{\mu^{\prime}}^{(1)} \subset \mathrm{V}^{(1)} \cap\left(\mathrm{I}_{\lambda}+\mathrm{U}_{\lambda}\right) \cdot \mathrm{I}_{\mu^{\prime}} & =\mathrm{V}^{(1)} \cap \mathrm{U}_{\lambda} \cdot \mathrm{I}_{\mu^{\prime}} \subset \mathrm{V}^{(1)} \cap \mathrm{I}_{\mu^{\prime}-\lambda+1} \\
& =\mathrm{V}_{\mu^{\prime}-\lambda+1}^{(1)}
\end{aligned}
$$

and

$$
\begin{aligned}
\mathrm{V}_{\lambda^{\prime}}^{(1)} \cdot \mathrm{V}_{\mu}^{(0)} \subset \mathrm{V}^{(1)} \cap \mathrm{I}_{\lambda^{\prime}} \cdot\left(\mathrm{I}_{\mu}+\mathrm{U}_{\mu}\right) & =\mathrm{V}^{(1)} \cap \mathrm{I}_{\lambda^{\prime}} \cdot \mathrm{U}_{\mu} \subset \mathrm{V}^{(1)} \cap \mathrm{I}_{\mu-\lambda^{\prime}} \\
& =\mathrm{V}_{\mu-\lambda^{\prime}}^{(1)} .
\end{aligned}
$$

Thus we have

$$
\begin{align*}
& \mathrm{V}_{\lambda}^{(0)} \cdot \mathrm{V}_{\mu^{\prime}}^{(1)} \subset \mathrm{V}_{-\lambda+\mu^{\prime}+1}^{(1)} \\
& \mathrm{V}_{\lambda^{\prime}}^{(1)} \cdot \mathrm{V}_{\mu}^{(0)} \subset \mathrm{V}_{-\lambda^{\prime}+\mu}^{(1)} \tag{10}
\end{align*}
$$

Consider the subspace $\mathrm{W}^{(1)}$ of $\mathrm{V}^{(1)}$ defined by

$$
\mathrm{W}^{(1)}=\left\{a \in \mathrm{~V}^{(1)} \mid\langle a, u\rangle=0\right\}
$$

The subspace $\mathrm{W}^{(1)}$ is invariant by $\mathrm{L}_{s}$. In fact for $a \in \mathrm{~W}^{(1)}$ using (8), (9) and $\mathrm{V}^{(1)} \cdot \mathrm{V}^{(1)}=\{0\}$ we have

$$
\begin{gathered}
\langle s \cdot a, u\rangle=-\langle a, s \cdot u\rangle+\langle a \cdot s, u\rangle+\langle s, a \cdot u\rangle=-\alpha\langle a, u\rangle \\
+2\langle s \cdot a, u\rangle=2\langle s \cdot a, u\rangle
\end{gathered}
$$

and $\langle s \cdot a, u\rangle=0$, consequently $s \cdot a \in \mathrm{~W}^{(1)}$. We denote by $\mathrm{W}_{\lambda}^{(1)}$ the eigenspace of $\mathrm{L}_{s}$ in $\mathrm{W}^{(1)}$.

Lemma 5.8. - Suppose $\rho^{\prime}=\nu^{\prime}-\beta+1$. If $\mathrm{W}_{\rho^{\prime}}^{(1)} \cdot \mathrm{V}_{\beta}^{(0)} \subset\{u\}$, then $\mathrm{V}_{\beta}^{(0)} \cdot \mathrm{W}_{\nu^{\prime}}^{(1)} \subset\{u\}$.

Proof. - Let $a_{1} \in \mathrm{~W}_{\nu^{\prime}}^{(1)}, \quad b_{1} \in \mathrm{~W}_{\rho^{\prime}}^{(1)} \quad$ and $\quad x \in \mathrm{~V}_{\beta}^{(0)}$. By (10) we have $x \cdot a_{1} \in \mathrm{~V}_{\rho^{\prime}}^{(1)}$ and $x \cdot b_{1} \in \mathrm{~V}_{\rho^{\prime}-\beta+1}^{(1)}$. Since $b_{1} \cdot x \in\{u\}$ and $\mathrm{W}^{(1)} \cdot \mathrm{W}^{(1)}=\{0\}$, we obtain

$$
\left\langle x \cdot b_{1}, a_{1}\right\rangle+\left\langle b_{1}, x \cdot a_{1}\right\rangle=\left\langle b_{1} \cdot x, a_{1}\right\rangle+\left\langle x, b_{1} \cdot a_{1}\right\rangle=0 .
$$

If $\rho^{\prime}-\beta+1 \neq \nu^{\prime}$, the orthogonality of the decomposition $\mathrm{V}^{(1)}=\mathrm{V}_{0}^{(1)}+\mathrm{V}_{1 / 2}^{(1)}$ implies $\left\langle b_{1}, x \cdot a_{1}\right\rangle=0 \quad$ and consequently $x \cdot a_{1} \in\{u\}$. If $\rho^{\prime}-\beta+1=\nu^{\prime}$, then $\beta=1$ and $\rho^{\prime}=\nu^{\prime}$. From this it follows $L_{x} W_{\nu^{\prime}}^{(1)} \subset V_{\nu^{\prime}}^{(1)}$. Define the mapping

$$
\mathrm{A}_{x}=p r \circ \mathrm{~L}_{x}: \mathrm{W}^{(1)} \longrightarrow \mathrm{W}^{(1)}
$$

where $p r$ is the projection from $\mathrm{V}^{(1)}=\mathrm{W}^{(1)}+\{u\}$ onto $\mathrm{W}^{(1)}$. Then we have $\left\langle\mathrm{A}_{x} b_{1}, a_{1}\right\rangle+\left\langle b_{1}, \mathrm{~A}_{x} a_{1}\right\rangle=0$ for all $a_{1}, b_{1} \in \mathrm{~W}_{\nu}^{(1)}$ and so $\mathrm{A}_{x}$ is skew symmetric on $\mathrm{W}_{\nu^{\prime}}^{(1)}$. On the other hand $\mathrm{A}_{x}$ has only real eigenvalues because the eigenvalues of $\mathrm{L}_{x}$ are real. This means $\mathrm{A}_{x}=0$ on $\mathrm{W}_{\nu^{\prime}}^{(1)}$ and $\mathrm{L}_{x} \mathrm{~W}_{\nu^{\prime}}^{(1)} \subset\{u\}$. Thus the proof of this lemma is completed.
q.e.d.

Lemma 5.9. - Let $a, b, c \in \mathrm{~V}^{(-1)}$. Then the products of $\bar{a}, \bar{b}^{\prime}$ and $\bar{c}^{\prime}$ are equal to 0 where $b^{\prime}=u \cdot b$ and $c^{\prime}=u \cdot c$.

Proof. - For each $b \in \mathrm{~V}^{(-1)}$ we denote by $b_{1}$ the element in $\mathrm{W}^{(1)}$ such that $\bar{b}_{1}=\bar{b}^{\prime}$. Let $\bar{a} \in \overline{\mathrm{~V}}_{\lambda}^{(-1)}, \bar{b} \in \overline{\mathrm{~V}}_{\mu}^{(-1)}$ and $\bar{c} \in \overline{\mathrm{~V}}_{\nu}^{(-1)}$. By Lemma 5.7 we see $\bar{b}^{\prime}=\bar{b}_{1} \in \overline{\mathrm{~V}}_{\mu-\alpha}^{(1)}, \bar{c}^{\prime}=\bar{c}_{1} \in \overline{\mathrm{~V}}_{\nu-\alpha}^{(-1)}$ and $\bar{a} \cdot \bar{b}^{\prime} \in \overline{\mathrm{V}}_{-\lambda+\mu+\alpha}^{(0)}$. We first prove
(i) $\left(\bar{a} \cdot \bar{b}^{\prime}\right) \cdot \bar{c}^{\prime}=0$.

According to Lemma 5.8, for the proof of (i) it suffices to show

$$
\begin{equation*}
\bar{d}_{1} \cdot\left(\bar{a} \cdot \bar{b}_{1}\right)=0 \quad \text { for all } \bar{d} \in \overline{\mathrm{~V}}_{\rho}^{(-1)} \tag{i}
\end{equation*}
$$

where $\rho=\lambda-\mu+\nu-\alpha+1$. From $W^{(1)} \cdot W^{(1)}=\{0\}$ it follows

$$
\bar{d}_{1} \cdot\left(\bar{a} \cdot \bar{b}_{1}\right)=\left(\bar{d}_{1} \cdot \bar{a}\right) \cdot \bar{b}_{1}-\left(\bar{a} \cdot \bar{d}_{1}\right) \cdot \bar{b}_{1} .
$$

Using Lemma 5.7 and (10) we have

$$
\begin{aligned}
& \bar{d}_{1} \cdot\left(\bar{a} \cdot \bar{b}_{1}\right) \in \overline{\mathrm{V}}_{-2 \lambda+2 \mu-\nu+3 \alpha-1}^{(1)}, \\
& \left(\bar{d}_{1} \cdot \bar{a}\right) \cdot \bar{b}_{1} \in \overline{\mathrm{~V}}_{\nu-3 \alpha+2}^{(1)}, \\
& \left(\bar{a} \cdot \bar{d}_{1}\right) \cdot \bar{b}_{1} \in \overline{\mathrm{~V}}_{2 \mu-\nu-\alpha}^{(1)} .
\end{aligned}
$$

(A) the case $\alpha=0$. By Lemma 5.5 we know $\lambda, \mu, \nu=0,1 / 2$. This implies $\nu-3 \alpha+2=\nu+2=2,5 / 2$. Consequently by (7) we have $\left(\bar{d}_{1} \cdot \bar{a}\right) \cdot \bar{b}_{1}=0$ and $\bar{d}_{1} \cdot\left(\bar{a} \cdot \bar{b}_{1}\right)=-\left(\bar{a} \cdot \bar{d}_{1}\right) \cdot \bar{b}_{1}$. If $\bar{d}_{1} \cdot\left(\bar{a} \cdot \bar{b}_{1}\right) \neq 0$, then we obtain $-2 \lambda+2 \mu-\nu+3 \alpha-1=2 \mu-\nu-\alpha$ and so $\lambda=-\frac{1}{2}$, which is a contradiction. Thus (i) ' holds.
(B) the case $\alpha=\frac{1}{2}$. By Lemma 5.5 we have $\lambda, \mu, \nu=\frac{1}{2}, 1$. Therefore we obtain $v-3 \alpha+2=\nu+\frac{1}{2}=1, \frac{3}{2}, \quad$ so by (7) $\left(\bar{d}_{1} \cdot \bar{a}\right) \cdot \bar{b}_{1}=0$ and
(a) $\bar{d}_{1} \cdot\left(\bar{a} \cdot \bar{b}_{1}\right)=-\left(\bar{a} \cdot \bar{d}_{1}\right) \cdot \bar{b}_{1}$.

This shows $\bar{d}_{1} \cdot\left(\bar{a} \cdot \bar{b}_{1}\right)=0$ if $-2 \lambda+2 \mu-\nu+3 \alpha-1 \neq 2 \mu-\nu-\alpha$. Thus we may assume $-2 \lambda+2 \mu-\nu+3 \alpha-1=2 \mu-\nu-\alpha$. Then it follows
(b)

$$
\alpha=\frac{1}{2}, \quad \lambda=\frac{1}{2}, \quad \rho=-\mu+\nu+1 .
$$

Let $h_{1} \in \mathrm{~W}_{2 \mu-\nu-\frac{1}{2}}^{(1)}$. Since $\mathrm{W}^{(1)} \cdot \mathrm{W}^{(1)}=\{0\}$, we have
(c) $\left\langle\left(a \cdot d_{1}\right) \cdot b_{1}, h_{1}\right\rangle=-\left\langle b_{1},\left(a \cdot d_{1}\right) \cdot h_{1}\right\rangle+\left\langle b_{1} \cdot\left(a \cdot d_{1}\right), h_{1}\right\rangle$.

Applying Lemma 5.7 and (10) we obtain

$$
\left(\bar{a} \cdot \bar{d}_{1}\right) \cdot \bar{h}_{1} \in \overline{\mathrm{~V}}_{3 \mu-2 \nu-\frac{1}{2}}^{(1)}, \bar{b}_{1} \cdot\left(\bar{a} \cdot \bar{d}_{1}\right) \in \overline{\mathrm{V}}_{-2 \mu+\nu+\frac{3}{2}}^{(1)}
$$

Therefore we have $\left\langle b_{1},\left(a \cdot d_{1}\right) \cdot h_{1}\right\rangle=0$ if $\mu-\alpha \neq 3 \mu-2 \nu-\frac{1}{2}$, i.e.,
(d)

$$
\left\langle b_{1},\left(a \cdot d_{1}\right) \cdot h_{1}\right\rangle=0 \quad \text { if } \quad \mu \neq \nu .
$$

If $\quad-2 \mu+\nu+\frac{3}{2} \neq 2 \mu-\nu-\frac{1}{2}$, then $\left\langle b_{1} \cdot\left(a \cdot d_{1}\right), h_{1}\right\rangle=0$. Suppose $-2 \mu+\nu+\frac{3}{2}=2 \mu-\nu-\frac{1}{2}$. Then we get $\nu=2 \mu-1$ and so $\mu=1, \nu=1$ or $\mu=\frac{1}{2}, \nu=0$. The case $\mu=\frac{1}{2}, \nu=0$ is impossible because $\nu=\frac{1}{2}, 1$. Consequently we have

$$
\begin{equation*}
\left\langle b_{1} \cdot\left(a \cdot d_{1}\right), h_{1}\right\rangle=0 \quad \text { except for } \quad \mu=\nu=1 . \tag{e}
\end{equation*}
$$

( $\mathrm{B}^{\prime}$ ) The case $\mu \neq \nu$. By (c) (d) (e) we have $\left(a \cdot d_{1}\right) \cdot b_{1} \in\{u\}$ and so by (a) $\bar{d}_{1} \cdot\left(\bar{a} \cdot \bar{b}_{1}\right)=-\left(\bar{a} \cdot \bar{d}_{1}\right) \cdot \bar{b}_{1}=0$.
( $\mathrm{B}^{\prime \prime}$ ) The case $\mu=\nu=\frac{1}{2}$. It follows then $b_{1}, h_{1},\left(a \cdot d_{1}\right) \cdot b_{1}$, $\left(a \cdot d_{1}\right) \cdot h_{1} \in \mathrm{~V}_{0}^{(1)} \quad$ and $\quad \mathrm{L}_{a \cdot d_{1}} \mathrm{~W}_{0}^{(1)} \subset \mathrm{V}_{0}^{(1)}$. Define the mapping $\mathrm{A}_{a \cdot d_{1}}=p r \circ \mathrm{~L}_{a \cdot d_{1}}: \mathrm{W}_{0}^{(1)} \longrightarrow \mathrm{W}_{0}^{(1)}$ where $p r$ is the projection from $\mathrm{V}_{0}^{(1)}=\mathrm{W}_{0}^{(1)}+\{u\}$ onto $\mathrm{W}_{0}^{(1)}$. (c) and (e) imply

$$
\left\langle\mathrm{A}_{a \cdot d_{1}} b, h_{1}\right\rangle=-\left\langle b_{1}, \mathrm{~A}_{a \cdot d_{1}} h_{1}\right\rangle
$$

and so $\mathrm{A}_{a \cdot d_{1}}$ is skew symmetric. Since the eigenvalues of

$$
\mathrm{A}_{a \cdot d_{1}}=p r \circ \mathrm{~L}_{a \cdot d_{1}}
$$

are all real, we obtain $\mathrm{A}_{a \cdot d_{1}}=0,\left(a \cdot d_{1}\right) \cdot b_{1} \in\{u\}$, and so by (a) $\bar{d}_{1} \cdot\left(\bar{a} \cdot \bar{b}_{1}\right)=-\left(\bar{a} \cdot \bar{d}_{1}\right) \cdot \bar{b}_{1}=0$.

Summing up the results mentioned above (A), ( $\mathrm{B}^{\prime}$ ) and ( $\mathrm{B}^{\prime \prime}$ ) we have

$$
\begin{align*}
& \bar{d}_{1} \cdot\left(\bar{a} \cdot \bar{b}_{1}\right)=0, \\
& \left(\bar{a} \cdot \bar{b}_{1}\right) \cdot \bar{c}_{1}=0 \tag{f}
\end{align*}
$$

except for the case $\alpha=\frac{1}{2}, \lambda=\frac{1}{2}, \mu=\nu=1, \rho=1$.
( $\mathrm{B}^{\prime \prime \prime}$ ) The case $\mu=\nu=1$. Then it follows $\alpha=\frac{1}{2}, \lambda=\frac{1}{2}$, $\mu=\nu=1, \rho=1$. Using $a \cdot b^{\prime}+a^{\prime} \cdot b, d \cdot b^{\prime}+d^{\prime} \cdot b \in \mathrm{~V}^{(1)}$ and $\mathrm{V}^{(1)} \cdot \mathrm{V}^{(1)}=\{0\}$, we get

$$
\begin{aligned}
& \bar{d}_{1} \cdot\left(\bar{a} \cdot \bar{b}_{1}\right)=\bar{d}^{\prime} \cdot\left(\bar{a} \cdot \bar{b}^{\prime}\right)=-\bar{d}^{\prime} \cdot\left(\bar{a}^{\prime} \cdot \bar{b}\right)=-\left(\bar{d}^{\prime} \cdot \bar{a}^{\prime}\right) \cdot \bar{b} \\
& \quad-\bar{a}^{\prime} \cdot\left(\overline{d^{\prime}} \cdot \bar{b}\right)+\left(\bar{a}^{\prime} \cdot \bar{d}^{\prime}\right) \cdot \bar{b}=-\bar{a} \cdot\left(\overline{d^{\prime}} \cdot \bar{b}\right)=\bar{a}^{\prime} \cdot\left(\bar{d} \cdot \bar{b}^{\prime}\right)=\overline{a_{1}} \cdot\left(\bar{d} \cdot \overline{b_{1}}\right) .
\end{aligned}
$$

For $h_{1} \in \mathrm{~W}_{1 / 2}^{(1)}$ we obtain

$$
\begin{aligned}
\left\langle a_{1} \cdot\left(d \cdot b_{1}\right), h_{1}\right\rangle=-\left\langle d \cdot b_{1}\right. & \left., a_{1} \cdot h_{1}\right\rangle+\left\langle\left(d \cdot b_{1}\right) \cdot a_{1}, h_{1}\right\rangle \\
& +\left\langle a_{1},\left(d \cdot b_{1}\right) \cdot h_{1}\right\rangle=\left\langle\left(d \cdot b_{1}\right) \cdot a_{1}, h_{1}\right\rangle
\end{aligned}
$$

because $a_{1} \cdot h_{1}=0$ and $\left(\bar{d} \cdot \bar{b}_{1}\right) \cdot \bar{h}_{1} \in \overline{\mathrm{~V}}_{1}^{(1)}=\{0\}$. Since $\bar{a}_{1} \cdot\left(\bar{d} \cdot \bar{b}_{1}\right)$, $\left(\bar{d} \cdot \bar{b}_{1}\right) \cdot \bar{a}_{1} \in \overline{\mathrm{~V}}_{1 / 2}^{(1)}$, we have $a_{1} \cdot\left(d \cdot b_{1}\right)-\left(d \cdot b_{1}\right) \cdot a_{1} \in\{u\} \quad$ and $\bar{d}_{1} \cdot\left(\bar{a} \cdot \bar{b}_{1}\right)=\bar{a}_{1} \cdot\left(\bar{d} \cdot \bar{b}_{1}\right)=\left(\bar{d} \cdot \bar{b}_{1}\right) \cdot \bar{a}_{1}$. (f) implies $\left(\bar{d} \cdot \bar{b}_{1}\right) \cdot \bar{a}_{1}=0$. Thus (i)' holds.

Therefore the proof of (i)' is completed.
Finally we show
(ii) $\bar{c}^{\prime} \cdot\left(\bar{a} \cdot \bar{b}^{\prime}\right)=0$,
(iii) $\left(\bar{b}^{\prime} \cdot \bar{a}\right) \cdot \bar{c}^{\prime}=0$,
(iv) $\bar{c}^{\prime} \cdot\left(\bar{b}^{\prime} \cdot \bar{a}\right)=0$.

Using (i) and $\mathrm{V}^{(1)} \cdot \mathrm{V}^{(1)}=\{0\}$, for $d_{1} \in \mathrm{~W}^{(1)}$ we get

$$
\begin{aligned}
\left\langle c_{1} \cdot\left(a \cdot b_{1}\right), d_{1}\right\rangle & =-\left\langle a \cdot b_{1}, c_{1} \cdot d_{1}\right\rangle+\left\langle\left(a \cdot b_{1}\right) \cdot\right. \\
& \left.c_{1}, d_{1}\right\rangle \\
& +\left\langle c_{1},\left(a \cdot b_{1}\right) \cdot d_{1}\right\rangle
\end{aligned}
$$

This implies (ii). From (i), $b^{\prime} \cdot a+b \cdot a^{\prime} \in \mathrm{V}^{(1)}$ and $\mathrm{V}^{(1)} \cdot \mathrm{V}^{(1)}=\{0\}$ we obtain $\left(\bar{b}^{\prime} \cdot \bar{a}\right) \cdot \bar{c}^{\prime}=-\left(\bar{b} \cdot \bar{a}^{\prime}\right) \cdot \bar{c}^{\prime}=0$. In the same way (iv) follows from (ii).

According to (i) - (iv) and $\mathrm{V}^{(1)} \cdot \mathrm{V}^{(1)}=\{0\}$, the proof of this lemma is completed.
q.e.d.

Lemma 5.10. - Let $a, b \in \mathrm{~V}^{(-1)}$. Then the products of $u, a^{\prime}, b$ are equal to 0 where $a^{\prime}=u \cdot a$.

Proof. - By $\mathrm{V}^{(1)} \cdot \mathrm{V}^{(1)}=\{0\}$ we obtain
(i) $u \cdot\left(a^{\prime} \cdot b\right)=0$,
(ii) $u \cdot\left(b \cdot a^{\prime}\right)=0$.

In fact we have $u \cdot\left(a^{\prime} \cdot b\right)=\left(u \cdot a^{\prime}\right) \cdot b+a^{\prime} \cdot(u \cdot b)-\left(a^{\prime} \cdot u\right) \cdot b=0$ and $u \cdot\left(b \cdot a^{\prime}\right)=(u \cdot b) \cdot a^{\prime}+b \cdot\left(u \cdot a^{\prime}\right)-(b \cdot u) \cdot a^{\prime}=0$. From (i) it follows
$\left\langle\left(a^{\prime} \cdot b\right) \cdot u, u\right\rangle+\left\langle u,\left(a^{\prime} \cdot b\right) \cdot u\right\rangle=\left\langle u \cdot\left(a^{\prime} \cdot b\right), u\right\rangle+\left\langle a^{\prime} \cdot b, u \cdot u\right\rangle=0$, so $\left\langle\left(a^{\prime} \cdot b\right) \cdot u, u\right\rangle=0$. This implies
(iii) $\left(a^{\prime} \cdot b\right) \cdot u=0$.

In the same way by (ii) we get
(iv) $\left(b \cdot a^{\prime}\right) \cdot u=0$.

The other cases easily follow from $\mathrm{V}^{(1)} \cdot \mathrm{V}^{(1)}=\{0\}$. q.e.d.

From Lemma 5.10 we have
Lemma 5.10'. - Let $a \in \mathrm{~V}^{(-1)}$ and $b^{1} \in \mathrm{~V}^{(1)}$. Then the products of $a, b^{1}, u$ are equal to 0 .

Lemma 5.11. - Let $a \in \mathrm{~V}^{(-1)}$ and $b^{1}, c^{1} \in \mathrm{~V}^{(1)}$. Then the products of $a, b^{1}, c^{1}$ are equal to 0 .

Proof. - By Lemma 5.9 we have $\left(a \cdot b^{1}\right) \cdot c^{1} \in\{u\}$. Using Lemma $5.10^{\prime}$ and $\mathrm{V}^{(1)} \cdot \mathrm{V}^{(1)}=\{0\}$ we get

$$
\begin{aligned}
& \left\langle u,\left(a \cdot b^{1}\right) \cdot c^{1}\right\rangle=-\left\langle\left(a \cdot b^{1}\right) \cdot u, c^{1}\right\rangle+\left\langle u \cdot\left(a \cdot b^{1}\right), c^{1}\right\rangle \\
& \quad+\left\langle a \cdot b^{1}, u \cdot c^{1}\right\rangle=0 .
\end{aligned}
$$

Thus we have $\left(a \cdot b^{1}\right) \cdot c^{1}=0$. By the same way we obtain

$$
c^{1} \cdot\left(a \cdot b^{1}\right)=0, \quad\left(b^{1} \cdot a\right) \cdot c^{1}=0, \quad c^{1} \cdot\left(b^{1} \cdot a\right)=0
$$

The other cases follow from $\mathrm{V}^{(1)} \cdot \mathrm{V}^{(1)}=\{0\}$. q.e.d.

Consider the centralizer Z of $\mathrm{V}^{(1)}$ in V ;

$$
\mathrm{Z}=\left\{z \in \mathrm{~V} \mid z \cdot a^{1}=a^{1} \cdot z=0 \quad \text { for all } \quad a^{1} \in \mathrm{~V}^{(1)}\right\}
$$

Then we have

Lemma 5.12. - Z is an ideal of V .
Proof. - Let $z \in \mathrm{Z}, a \in \mathrm{~V}$. We have
$u \cdot(z \cdot a)=(u \cdot z) \cdot a+z \cdot(u \cdot a)-(z \cdot u) \cdot a=0$, $u \cdot(a \cdot z)=(u \cdot a) \cdot z+a \cdot(u \cdot z)-(a \cdot u) \cdot z=0$ and so $z \cdot a, a \cdot z \in \mathrm{~V}^{(0)}$. From this $\mathrm{V}^{(1)}$ is invariant by $\mathrm{L}_{z \cdot a}$, $\mathrm{R}_{z \cdot a}, \mathrm{~L}_{a \cdot z}$ and $\mathrm{R}_{a \cdot z}$. Using Lemma 5.11 and $\mathrm{V}^{(1)} . \mathrm{V}^{(1)}=\{0\}$, for $b^{1}, c^{1} \in \mathrm{~V}^{(1)}$ we get

$$
\begin{aligned}
\left\langle\mathrm{L}_{z \cdot a} b^{1}\right. & \left., c^{1}\right\rangle+\left\langle b^{1}, \mathrm{~L}_{z \cdot a} c^{1}\right\rangle=\left\langle b^{1} \cdot(z \cdot a), c^{1}\right\rangle+\left\langle z \cdot a, b^{1} \cdot c^{1}\right\rangle \\
& =\left\langle b^{1} \cdot(z \cdot a), c^{1}\right\rangle=\left\langle\left(b^{1} \cdot z\right) \cdot a+z \cdot\left(b^{1} \cdot a\right)-\left(z \cdot b^{1}\right) \cdot a, c^{1}\right\rangle \\
& =\left\langle z \cdot\left(b^{1} \cdot a\right), c^{1}\right\rangle=-\left\langle z \cdot c^{1}, b^{1} \cdot a\right\rangle+\left\langle c^{1} \cdot z, b^{1} \cdot a\right\rangle \\
& +\left\langle z, c^{1} \cdot\left(b^{1} \cdot a\right)\right\rangle \\
& 0 .
\end{aligned}
$$

This means that $\mathrm{L}_{z . a}$ is skew symmetric. On the other hand the eigenvalues of $\mathrm{L}_{z \cdot a}$ are all real. Therefore it must be $\mathrm{L}_{z \cdot a}=0$ on $\mathrm{V}^{(1)}$, i.e., $(z \cdot a) \cdot b^{1}=0$ for all $b^{1} \in \mathrm{~V}^{(1)}$. From this it follows

$$
\begin{aligned}
& \left\langle b^{1} \cdot(z \cdot a), c^{1}\right\rangle=-\left\langle z \cdot a, b^{1} \cdot c^{1}\right\rangle+\left\langle(z \cdot a) \cdot b^{1}, c^{1}\right\rangle \\
& \\
& +\left\langle b^{1},(z \cdot a) \cdot c^{1}\right\rangle=0 \text { for all } b^{1}, c^{1} \in \mathrm{~V}^{(1)}
\end{aligned}
$$

and so $b^{1} \cdot(z \cdot a)=0 \quad$ for all $b^{1} \in \mathrm{~V}^{(1)}$. Thus we get
(a)

$$
z \cdot a \in \mathbb{Z}
$$

Applying Lemma 5.11 and $\mathrm{V}^{(1)} \cdot \mathrm{V}^{(1)}=\{0\}$, we obtain

$$
\begin{aligned}
\left\langle\mathrm{L}_{a \cdot z} b^{1}\right. & \left., c^{1}\right\rangle+\left\langle b^{1}, \mathrm{~L}_{a \cdot z} c^{1}\right\rangle=\left\langle b^{1} \cdot(a \cdot z), c^{1}\right\rangle+\left\langle a \cdot z, b^{1} \cdot c^{1}\right\rangle \\
= & \left\langle b^{1} \cdot(a \cdot z), c^{1}\right\rangle=\left\langle\left(b^{1} \cdot a\right) \cdot z+a \cdot\left(b^{1} \cdot z\right)-\left(a \cdot b^{1}\right) \cdot z, c^{1}\right\rangle \\
= & \left\langle\left(b^{1} \cdot a-a \cdot b^{1}\right) \cdot z, c^{1}\right\rangle=-\left\langle\left(b^{1} \cdot a-a \cdot b^{1}\right) \cdot c^{1}, z\right\rangle \\
& \quad+\left\langle c^{1} \cdot\left(b^{1} \cdot a-a \cdot b^{1}\right), z\right\rangle+\left\langle b^{1} \cdot a-a \cdot b^{1}, c^{1} \cdot z\right\rangle=0
\end{aligned}
$$

for all $b^{1}, c^{1} \in \mathrm{~V}^{(1)}$. Consequently $\mathrm{L}_{a \cdot z}$ is skew symmetric on $\mathrm{V}^{(1)}$. Since the eigenvalues of $\mathrm{L}_{a \cdot z}$ are real, we have $\mathrm{L}_{a \cdot z}=0$ on $\mathrm{V}^{(1)}$, i.e., $(a \cdot z) \cdot b^{1}=0$ for all $b^{1} \in \mathrm{~V}^{(1)}$. Using this and $\mathrm{V}^{(1)} \cdot \mathrm{V}^{(1)}=\{0\}$ we get

$$
\begin{aligned}
\left\langle b^{1} \cdot(a \cdot z), c^{1}\right\rangle & =-\left\langle a \cdot z, b^{1} \cdot c^{1}\right\rangle+\left\langle(a \cdot z) \cdot b^{1}, c^{1}\right\rangle+\left\langle b^{1},(a \cdot z) \cdot c^{1}\right\rangle \\
& =0
\end{aligned}
$$

for all $b^{1}, c^{1} \in \mathrm{~V}^{(1)}$ and hence
(b)

$$
b^{1} \cdot(a \cdot z)=0 \quad \text { for all } \quad b^{1} \in \mathrm{~V}^{(1)}
$$

Therefore we have $a \cdot z \in Z$. (a) and (b) imply that $Z$ is an ideal of $V$. q.e.d.

Let $C$ denote the center of $Z$;

$$
\mathrm{C}=\{c \in \mathrm{Z} \mid c \cdot z=z \cdot c=0 \quad \text { for all } \quad z \in \mathbf{Z}\}
$$

Then we have

Lemma 5.13. - C is a commutative ideal of V containing $u$.
Proof. - From $\mathrm{C} \supset \mathrm{V}^{(1)}$ it follows $u \in \mathrm{C}$. Let $c \in \mathrm{C}, x \in \mathrm{~V}$. Since $Z$ is an ideal of $V$, we have

$$
z \cdot(c \cdot x)=(z \cdot c) \cdot x+c \cdot(z \cdot x)-(c \cdot z) \cdot x=0
$$

and $z \cdot(x \cdot c)=(z \cdot x) \cdot c+x \cdot(z \cdot c)-(x \cdot z) \cdot c=0$ for all $z \in \mathrm{Z}$. This implies
(a)

$$
\mathrm{R}_{a}=0 \text { on } \mathrm{Z}
$$

where $a=c \cdot x$ or $x \cdot c$. Using this and Lemma 3.2, for $z, z^{\prime} \in \mathrm{Z}$ we get
(b)

$$
\begin{aligned}
& \frac{d^{2}}{d t^{2}}\left\langle\exp \mathrm{tL}_{a} z, \exp \mathrm{tL}_{a} z^{\prime}\right\rangle=\frac{d}{d t}\left\langle a, \exp \mathrm{tL}_{a}\left(z \cdot z^{\prime}\right)\right\rangle \\
& =\left\langle a, \mathrm{~L}_{a}\left(\exp \mathrm{tL}_{a}\left(z \cdot z^{\prime}\right)\right)\right\rangle=-\langle w, a \cdot a\rangle+\langle w \cdot a, a\rangle \\
& \quad+\langle a, w \cdot a\rangle=0
\end{aligned}
$$

where $w=\exp \operatorname{tL}_{a}\left(z \cdot z^{\prime}\right) \in Z$. Let $\lambda$ be an eigenvalue of $L_{a}$ on $Z$ and $z$ an eigenvector corresponding to $\lambda$. Then we have $\frac{d^{2}}{d t^{2}}\left\langle\exp \mathrm{tL}_{a} z, \exp \mathrm{tL}_{a} z\right\rangle=\frac{d^{2}}{d t^{2}}\langle z, z\rangle e^{2 \lambda t}=(2 \lambda)^{2} e^{2 \lambda t}\langle z, z\rangle$ and by (b) $\lambda=0$. Thus the eigenvalues of $L_{a}$ on $Z$ are equal to 0 . We show

$$
\begin{equation*}
\mathrm{L}_{a}=0 \text { on } \mathrm{Z} \tag{c}
\end{equation*}
$$

Suppose $\mathrm{L}_{a} \neq 0$ on Z . Then there exist elements $z, w \in \mathrm{~V}$ such that $\mathrm{L}_{a} w=0, w=\mathrm{L}_{a} z \neq 0$. Since $\exp \mathrm{tL}_{a} z=z+t w$, we have $\frac{d^{2}}{d t^{2}}\left\langle\exp \mathrm{tL}_{a} z, \exp \mathrm{~L}_{a} z\right\rangle=\frac{d^{2}}{d t^{2}}\langle z+t w, z+t w\rangle$

$$
=2\langle w, w\rangle t+2\langle z, w\rangle
$$

which contradicts to (b). Thus (c) holds. (a) and (c) imply $a \in C$ and consequently $c \cdot x, x \cdot c \in \mathrm{C}$. Therefore C is an ideal of V . q.e.d.

Proposition 5.1 follows from Lemma 5.13.

## 6. Proof of Theorem 3.1.

We first consider the case $u \cdot u=u$. By Proposition 4.1 we have the orthogonal decomposition $\mathrm{V}=\{u\}+\mathrm{V}_{1 / 2}+\mathrm{V}_{0}$. Since $V_{0}$ is a subalgebra, by the inductive assumption we get $V_{0}=I+U_{0}$, where $I$ is a commutative ideal of $V_{0}$ and $U_{0}$ is a subalgebra with principal idempotent $s_{0}$. Put $\mathrm{E}=\{u\}+\mathrm{V}_{1 / 2}$. Then E is an ideal of $V$. Let $a \in I$. Since $E$ is invariant under $L_{a}, R_{a}$ and is orthogonal to $a$ and since $a \cdot a=0$, by Lemma 3.3 we obtain $\mathrm{L}_{a}=\mathrm{R}_{a}=0$ on $E$. From this we know that $I$ is a commutative ideal of $V$. Put

$$
\begin{aligned}
\mathrm{U} & =\mathrm{E}+\mathrm{U}_{0} \\
s & =u+s_{0}
\end{aligned}
$$

Using Proposition 4.1 (iv), $u \cdot u=u$ and $s_{0} \cdot s_{0}=s_{0}$, we have (i) $s \cdot s=s$.

By Proposition 4.1 (iv) we have $\mathrm{L}_{u}=\mathrm{R}_{u}=0$ on $\mathrm{U}_{0}$. Therefore $\mathrm{L}_{s}=\mathrm{L}_{s_{0}}$ is diagonalizable on $\mathrm{U}_{0}$ and its eigenvalues on $\mathrm{U}_{0}$ are equal to $1 / 2,1$ and moreover $\mathrm{R}_{s}=\mathrm{R}_{s_{0}}=2 \mathrm{~L}_{s_{0}}-1=2 \mathrm{~L}_{s}-1$ on $\mathrm{U}_{0}$. Since E is invariant under $\mathrm{L}_{s_{0}}, \mathrm{R}_{s_{0}}$ and is orthogonal to $s_{0}$ and since $s_{0} \cdot s_{0}=s_{0}$, applying Lemma 3.3 it follows that the restriction of $L_{s_{0}}$ on E is diagonalizable and its eigenvalues are $0,1 / 2$ and that $\mathrm{R}_{s_{0}}=2 \mathrm{~L}_{s_{0}}$ on E . Therefore using $\mathrm{L}_{s_{0}} u=0$, $\mathrm{L}_{s_{0}} \mathrm{~V}_{1 / 2} \subset \mathrm{~V}_{1 / 2}$ and $\mathrm{L}_{u}=1 / 2$ on $\mathrm{V}_{1 / 2}, \mathrm{~L}_{s}=\mathrm{L}_{u}+\mathrm{L}_{s_{0}}$ is diagonalizable on E and its eigenvalues on E are equal to $1 / 2,1$. Since $\mathrm{R}_{u}=2 \mathrm{~L}_{u}-1$ and $\mathrm{R}_{s_{0}}=2 \mathrm{~L}_{s_{0}}$ hold on E , we have $\mathrm{R}_{s}=2 \mathrm{~L}_{s}-1$ on E . Thus we obtain
(ii) The restriction of $\mathrm{L}_{s}$ on U is diagonalizable and its eigenvalues on U are equal to $1 / 2,1$.
(iii) $\mathrm{R}_{s}=2 \mathrm{~L}_{s}-1$ on U .
(i) (ii) (iii) imply that $s$ is a principal idempotent of U . Thus in the case $u \cdot u=u$ the proof of Theorem 3.2 is completed.

Next we consider the case $u \cdot u=0$. By Proposition 5.1 there exists a commutative ideal C of V containing $u$. Let $\mathrm{V}^{\prime}$ be the orthogonal complement of C in V . By Lemma $3.1 \mathrm{~V}^{\prime}$ is a subalgebra. From the inductive assumption we get $\mathrm{V}^{\prime}=\mathrm{I}^{\prime}+\mathrm{U}$, where $\mathrm{I}^{\prime}$ is a commutative ideal of $\mathrm{V}^{\prime}$ and U is a subalgebra with principal idempotent $s$. Let $a^{\prime} \in \mathrm{I}^{\prime}$. Since C is invariant under $\mathrm{L}_{a^{\prime}}$, $\mathrm{R}_{a^{\prime}}$ and $\mathrm{C} \cdot \mathrm{C}=\{0\}$ and since $a^{\prime} \cdot a^{\prime}=0$, by Lemma 3.3 we obtain $\mathrm{L}_{a^{\prime}}=\mathrm{R}_{a^{\prime}}=0$ on C . This shows that $\mathrm{I}=\mathrm{C}+\mathrm{I}^{\prime}$ is a commutative ideal of V . Thus the decomposition $\mathrm{V}=\mathrm{I}+\mathrm{U}$ has the desired properties.

Therefore the proof of Theorem 3.1 is completed. q.e.d.

## 7. Proof of Main Theorem 2) and Corollaries.

Let $V$ be the tangent space of $M$ at $x$. In view of Main Theorem 1), Proposition 2.4 and Theorem 2.1 V admits a structure of normal Hessian algebra and $E_{x}=T(V) 0$.

Proof of Main Theorem 2). - According to Theorem 3.1 the normal Hessian algebra $V$ is decomposed in $V=I+U$, where I is a commutative ideal of V and U is a clan. Denote by $\mathrm{T}(\mathrm{I})$ the commutative normal subgroup of $\mathrm{T}(\mathrm{V})$ generated by $\left\{\mathrm{X}_{a}^{*} \mid a \in \mathrm{I}\right\}$ and $T(U)$ the subgroup of $T(V)$ generated by $\left\{X_{w}^{*} \mid w \in U\right\}$. Then we get $T(V)=T(I) T(U)$. Let $E_{x}^{+}$denote the orbit of $T(U)$ through the origin $0 ; \mathrm{E}_{x}^{+}=\mathrm{T}(\mathrm{U}) 0$. For $a \in \mathrm{I}, v^{+} \in \mathrm{E}_{x}^{+}$we have $\exp \mathrm{X}_{a}^{*} v^{+}=v^{+}+\sum_{k=0}^{\infty} \frac{\mathrm{L}_{a}^{k+1}}{(k+1)!}\left(\mathrm{L}_{a} v^{+}+a\right)=a+a \cdot v^{+}+v^{+}$because I is a commutative ideal of V . Thus $\mathrm{T}(\mathrm{I}) v^{+} \subset \mathrm{I}+v^{+}$. Suppose $v^{+}=h 0$ where $h \in \mathrm{~T}(\mathrm{U})$. Since

$$
\mathrm{T}(\mathrm{I}) v^{+}=\mathrm{T}(\mathrm{I}) h 0=h h^{-1} \mathrm{~T}(\mathrm{I}) h 0=h \mathrm{~T}(\mathrm{I}) 0=h \mathrm{I}
$$

and since $h$ is an affine transformation of V , we obtain $\mathrm{T}(\mathrm{I}) v^{+}=\mathrm{I}+v^{+}$.
Therefore, putting $\mathrm{E}_{x}^{0}=\mathrm{I}$ we get

$$
\mathrm{E}_{x}=\mathrm{T}(\mathrm{~V}) 0=\mathrm{T}(\mathrm{I}) \mathrm{T}(\mathrm{U}) 0=\mathrm{T}(\mathrm{I}) \mathrm{E}_{x}^{+}=\mathrm{E}_{x}^{0}+\mathrm{E}_{x}^{+}
$$

Let $p: \mathrm{E}_{x} \longrightarrow \mathrm{E}_{x}^{+}$denote the projection from $\mathrm{E}_{x}=\mathrm{E}_{x}^{0}+\mathrm{E}_{x}^{+}$onto $\mathrm{E}_{x}^{+}$. Then $\mathrm{E}_{x}$ admits a fibering with projection $p$. Since U is a clan, applying Theorem 2.2 (Vinberg's result) the base space $\mathrm{E}_{x}^{+}$ is an affine homogeneous convex domain not containing any full straight line. The fiber $p^{-1}\left(v^{+}\right)=\mathrm{T}(\mathrm{I}) v^{+}=\mathrm{E}_{x}^{0}+v^{+}$over $v^{+} \in \mathrm{E}_{x}^{+}$ is an affine subspace of V and a Euclidean space with respect to the induced metric because $T(I)$ is commutative. It is clear that the fiber $\mathrm{E}_{x}^{0}+v$ through $v \in \mathrm{E}_{x}$ is characterized as the set of all points which can be joined with $v$ by full straight lines contained in $E_{x}$. This implies that our fibering of $E_{x}$ is unique and that every affine transformation of $E_{x}$ is fiber preserving. q.e.d.

Proof of Corollary 1. - If we put $\alpha_{x}(v)=\operatorname{Tr} \mathrm{L}_{v}$ for $v \in \mathrm{~V}$, the value $\beta_{x}$ of the canonical bilinear form $\beta$ at $x$ has an expression (cf. [8]) $\beta_{x}(v, w)=\alpha_{x}(v \cdot w)$ for $v, w \in \mathrm{~V}$. By Theorem 3.1 V is decomposed in $V=I+U$, where $I$ is a commutative ideal of V and U is a clan. I being a commutative ideal of V we get

$$
\begin{align*}
& \alpha_{x}(a)=0  \tag{1}\\
& \beta_{x}(a, v)=0, \quad \text { for } \quad a \in \mathrm{I}, v \in \mathrm{~V}
\end{align*}
$$

Because $\quad\langle v \cdot a, b\rangle+\langle a, v \cdot b\rangle=\langle a \cdot v, b\rangle+\langle v, a \cdot b\rangle=\langle a \cdot v, b\rangle$ for $a, b \in \mathrm{I}$ and $v \in \mathrm{~V}$, we have

$$
\begin{equation*}
\mathrm{L}_{v}+{ }^{t} \mathrm{~L}_{v}=\mathrm{R}_{v} \quad \text { on } \mathrm{I} \tag{2}
\end{equation*}
$$

Since $U$ is a clan, it follows

$$
\begin{equation*}
\mathrm{Tr}_{\mathrm{U}} \mathrm{~L}_{v . v}>0 \quad \text { for } v \neq 0 \in \mathrm{U} \tag{3}
\end{equation*}
$$

Using $\mathrm{R}_{v . v}=\mathrm{R}_{v} \mathrm{R}_{v}+\left[\mathrm{L}_{v}, \mathrm{R}_{v}\right]$ and (2) we obtain

$$
\mathrm{Tr}_{\mathrm{I}} \mathrm{~L}_{v \cdot v}=\frac{1}{2} \mathrm{Tr}_{\mathrm{I}} \mathrm{R}_{v \cdot v}=\frac{1}{2} \mathrm{Tr}_{\mathrm{I}} \mathrm{R}_{v}{ }^{t} \mathrm{R}_{v} \geqslant 0
$$

From this and (3) we get $\beta_{x_{0}}(v, v)=\operatorname{Tr}_{\mathrm{I}} \mathrm{L}_{v \cdot v}+\mathrm{Tr}_{\mathrm{U}} \mathrm{L}_{v \cdot v}>0$ for all $v \neq 0 \in U$. This together with (1) implies that $\beta_{x}$ is positive semi-definite and that the null space of $\beta_{x}$ coincides with $\mathrm{E}_{x}^{0}=\mathrm{I}$.
q.e.d.

Proof of Corollary 2. - Let $v \in \mathrm{E}_{x}$. Since the fiber $\mathrm{E}_{x}^{0}+v$ through $v$ is an affine subspace of V , it follows $d(v, w)=0$ for all $w \in \mathrm{E}_{x}^{0}+v$ (cf. [5]). Conversely, suppose $d(v, w)=0$. Then we get $0 \leqslant c_{\mathrm{E}_{x}^{+}}^{a}(p(v), p(w)) \leqslant c_{\mathrm{E}_{x}}^{a}(v, w) \leqslant d(v, w)=0$ because the projection $p: \mathrm{E}_{x} \longrightarrow \mathrm{E}_{x}^{+}$is an affine mapping. By a result of Vey [11] $c_{\mathrm{E}_{x}^{+}}^{a}$ is a distance on $\mathrm{E}_{x}^{+}$. This implies $p(v)=p(w)$.

Proof of Corollary 3. - Our assertion follows from the facts that the covering projection $\exp _{x}: \mathrm{E}_{x}=\mathrm{E}_{x}^{0}+\mathrm{E}_{x}^{+} \longrightarrow \mathrm{M}$ is an affine mapping and that $\mathrm{E}_{x}^{0}$ is an affine subspace of V .
q.e.d.

Let $G$ be a connected Lie subgroup of $\operatorname{Aut}(M)$ which acts transitively on $M$ and $B$ the isotropy subgroup of $G$ at a point $x$ in $\mathrm{M} ; \mathrm{M}=\mathrm{G} / \mathrm{B}$. We denote by $\widetilde{\mathrm{G}}$ the universal covering group of $G$ and by $\pi: \widetilde{G} \longrightarrow G$ the covering projection. Then $\widetilde{M}=\widetilde{G} / \widetilde{B}$ is the universal covering manifold of $M=G / B$, where $\widetilde{B}$ is the identity component of $\pi^{-1}(\mathrm{~B})$. Let $\widetilde{\mathrm{N}}$ be the normal subgroup of $\widetilde{\mathrm{G}}$ consisting of all elements in $\widetilde{\mathrm{G}}$ which induce the identity transformation of $\widetilde{M}$. We put $\mathrm{G}^{*}=\widetilde{\mathrm{G}} / \widetilde{\mathrm{N}}, \mathrm{B}^{*}=\widetilde{\mathrm{B}} / \widetilde{\mathrm{N}}$. According to Main Theorem 1) it follows that $\widetilde{M}=G^{*} / B^{*}$ is a convex domain in $\mathbf{R}^{n}$ and that $G^{*}$ is a subgroup of the affine transformation group $\mathrm{A}(n)$ of $\mathbf{R}^{n}$.

Proof of Corollary 4. - Assume G is not solvable. Since G* is not solvable, there exists a connected semi-simple Lie subgroup $\mathrm{S}^{*}$ of $\mathrm{G}^{*}$. Let $\mathrm{K}^{*}$ be a maximal compact subgroup of $\mathrm{S}^{*}$. Since $\widetilde{\mathrm{M}}$ is a convex domain in $\mathrm{R}^{n}, \mathrm{~K}^{*}$ has a fixed point $\tilde{y}$ in $\widetilde{\mathrm{M}}$.

Therefore we have

$$
\operatorname{dim} \mathrm{G}^{*}=\operatorname{dim} \tilde{\mathrm{M}}=\operatorname{dim} \mathrm{G}^{*} \tilde{y} \leqslant \operatorname{dim} \mathrm{G}^{*}-\operatorname{dim} \mathrm{K}^{*}<\operatorname{dim} \mathrm{G}^{*},
$$ which is a contradiction. Thus $G$ must be a solvable Lie group. q.e.d.

Proof of Corollary 5. - Let G be a transitive reductive Lie subgroup of $\operatorname{Aut}(\mathrm{M})$ and let $g$ be the Lie algebra of $G$. Then $g$ is decomposed into the direct sum $\mathfrak{g}=\mathfrak{c}+\mathfrak{z}$ where $\mathfrak{c}$ is the center of $g$ and $\mathfrak{g}$ the semi-simple part of $g$. Denoting by $C^{*}$ and $S^{*}$ the connected Lie subgroup of $G^{*}$ corresponding to $\mathfrak{c}$ and $\mathfrak{F}$ respectively, we have $\mathrm{G}^{*}=\mathrm{C}^{*} \mathrm{~S}^{*}$. Since $\mathrm{S}^{*}$ is a connected semisimple Lie subgroup of $\mathrm{A}(n), \mathrm{S}^{*}$ is closed in $\mathrm{A}(n)$ (cf. [15]). Let $\overline{\mathrm{C}}^{*}$ denote the closure of $\mathrm{C}^{*}$ in $\mathrm{A}(n)$. Then the subgroup $\overline{\mathrm{C}}^{*} \mathrm{~S}^{*}$ is closed in $\mathrm{A}(n)$ (cf. [3]) and so coincides with the closure $\overline{\mathrm{G}}^{*}$ of $\mathrm{G}^{*}$ in $\mathrm{A}(n)$. It is easy to see that every element in $\overline{\mathrm{G}}^{*}$ preserves the domain $\widetilde{M}$ and leaves invariant the Hessian metric on $\widetilde{\mathrm{M}}$. Denoting by $\mathrm{K}_{c}^{*}$ and $\mathrm{K}_{s}^{*}$ maximal compact subgroups of $\overline{\mathrm{C}}^{*}$ and $\mathrm{S}^{*}$ respectively, the group $\mathrm{K}^{*}=\mathrm{K}_{c}^{*} \mathrm{~K}_{s}^{*}$ is a maximal compact subgroup of $\overline{\mathrm{G}}^{*}=\overline{\mathrm{C}}^{*} \mathrm{~S}^{*}$ because the center of $\mathrm{S}^{*}$ is finite. Since $\widetilde{\mathrm{M}}$ is a convex domain in $\mathbf{R}^{n}, \mathrm{~K}^{*}$ has a fixed point $\widetilde{o}$ in $\widetilde{\mathrm{M}}$. We may assume that $\widetilde{o}$ is the origin in $\mathbf{R}^{n}$. The isotropy subgroup $\mathrm{K}^{* \prime}$ of $\overline{\mathrm{G}}^{*}$ at $\widetilde{o}$ is contained in an orthogonal group and is closed in $\overline{\mathrm{G}}^{*}$. Thus $\mathrm{K}^{* \prime}$ is a compact subgroup of $\overline{\mathrm{G}}^{*}$ containing $\mathrm{K}^{*}$ and so $\mathrm{K}^{* \prime}=\mathrm{K}^{*}$. Since $\overline{\mathrm{G}}^{*}$ acts effectively on $\widetilde{\mathrm{M}}, \overline{\mathrm{K}}_{c}^{*}$ is reduced to the identity and so $\mathrm{K}^{* \prime}=\mathrm{K}^{*}=\mathrm{K}_{s}^{*}$. We denote by $\overline{\mathfrak{g}}^{*}, \overline{\mathrm{c}}^{*}, \mathfrak{F}^{*}$ and $\mathfrak{f}_{s}^{*}$ the Lie algebras of $\overline{\mathrm{G}}^{*}, \overline{\mathrm{C}}^{*}, \mathrm{~S}^{*}$ and $\mathrm{K}_{s}^{*}$ respectively, and by $\mathfrak{p}_{s}^{*}$ the orthogonal complement of $\mathfrak{f}_{s}^{*}$ in $\mathfrak{S}^{*}$ with respect to the Killing form of $\mathfrak{s}^{*}$. Putting $\mathfrak{f}^{*}=\mathfrak{f}_{s}^{*}$ and $\mathfrak{p}^{*}=\overline{\mathfrak{c}}^{*}+\mathfrak{p}_{s}^{*}$, we have

$$
\overline{\mathfrak{g}}^{*}=\mathfrak{f}^{*}+\mathfrak{p}^{*},\left[\mathfrak{f}^{*}, \mathfrak{f}^{*}\right] \subset \mathfrak{f}^{*},\left[\mathfrak{f}^{*}, \mathfrak{p}^{*}\right] \subset \mathfrak{p}^{*},\left[\mathfrak{p}^{*}, \mathfrak{p}^{*}\right] \subset \mathfrak{f}^{*}
$$

From this using the same argument as in [9] it follows that $\tilde{\mathbf{M}}=\mathrm{G}^{*} / \mathrm{K}^{*}$ is the direct product of a Euclidean space and an affine homogeneous convex self-dual cone not containing any full straight line. q.e.d.

Proof of Corollary 6. - Since $M$ is compact, the automorphism group $G=\operatorname{Aut}(\mathrm{M})$ is compact. Therefore the Lie algebra $g$ of $G$ is decomposed into the direct sum $\mathfrak{g}=\mathfrak{c}+\mathfrak{z}$ where $\mathfrak{c}$ is the center of $\mathfrak{g}$ and $\mathfrak{z}$ is a compact semi-simple subalgebra of $\mathfrak{g}$. Denote by

C* and $S^{*}$ the connected Lie subgroups of $G^{*}$ corresponding to $c$ and $\mathfrak{i}$ respectively. Then $G^{*}=C^{*} S^{*}$, and $S^{*}$ is compact by a theorem of Weyl. Since $\widetilde{M}=G^{*} / B^{*}$ is a convex domain, $S^{*}$ has a fixed point in $M$. Therefore $B^{*} \supset S^{*}$ and so $S^{*}$ is a normal subgroup of $G^{*}$ contained in $B^{*}$. From this and the effectiveness, $S^{*}$ is reduced to the identity. Thus we have $g=c$. Consequently G is commutative and M is a Euclidean torus. q.e.d.
