# OPTIMIZATION OF THE DOMAIN IN ELLIPTIC UNILATERAL BOUNDARY VALUE PROBLEMS BY FINITE ELEMENT METHOD (*) 

by I. Hlaváček ( ${ }^{1}$ ) and J. Nečas $\left({ }^{2}\right)$<br>Communicated by P G Ciarlet

#### Abstract

Resumé - On considère le probleme de la minimisatıon d'une fonctıon coût par rapport au domaıne, ou la fonctıon d'état est la solutıon d'une équatıon elliptıque avec des conditıons aux limites du type de Signorinı sur une partıe de la frontıère varıable On démontre (1) l'existence d'une solution pour quatre differentes fonctions coût et (11) la convergence des approximations par éléments finis dans un certain sens

Abstract - The problem of the minimization of a cost functional with respect to the domain is considered, where the state variable has to solve an elliptic equation with boundary conditions of Signorini's type on a part of the variable boundary We prove (1) the existence of an exact solution for four different cost functionals and (11) the convergence of finite element approximations in a certain sense

## INTRODUCTION

Some problems of the optimal design remain open up to this time, although they are of interest from the physical point of view. Thus for instance in some problems of the contact between elastic bodies the shape of the boundaries should be optimized to obtain minimal cost functional such as the integral of energy, contact forces or displacements.

It is the aim of the present paper to start the analysis of this class of problems on a simplified model with a unilateral problem in $R^{2}$ for the Poisson equation and boundary conditions of Signorini's type. On a given part of the boundary

[^0]the Dirichlet homogeneous condition is prescribed and the remaining part - with unilateral conditions - has to be determıned

In Section 1 we present a proof of existence of a solution for four different cost functionals and for one common state problem, which is formulated in terms of a variational inequality on a variable domain

In Section 2 a finite element approximation is proposed, following the method of Begis and Glowinskı [2] who employed precewise linear approxımations of the unknown part of the boundary and piecewise bilinear finite elements on a uniform mesh in a reference square domain In Section 3 we prove that some subsequence of the approximate solutions converges to an exact solution uniformly, whereas the corrcsponding solutions of the state problem converge weakly in each interior subdomain of the optımal domain

## 1. EXISTENCE OF A SOLUTION TO THE MODEL PROBLEMS

Let us consider the following model problems Let $\Omega(v) \subset \mathbb{R}^{2}$ be the domain (see fig 1)

Figure 1.

$$
\Omega(v)=\left\{0<x_{1}<v\left(x_{2}\right), 0<x_{2}<1\right\},
$$

where the function $v$ is to be determined from the problem

$$
\mathscr{J}_{\mathfrak{l}}(v)=\min _{w \in \mathscr{U}_{a d}} \mathscr{F}_{\imath}(w)
$$

Here

$$
\begin{gathered}
\mathscr{U}_{a d}=\left\{w \in C^{(0), 1}([0,1]) \quad\right. \text { (1e Lipschitz function) } \\
\left.0<\alpha \leqq w \leqq \beta, \quad\left|d w / d x_{2}\right| \leqq C_{1}, \quad \int_{0}^{1} w\left(x_{2}\right) d x_{2}=C_{2}\right\}
\end{gathered}
$$

with given constants $\alpha, \beta, C_{1}, C_{2}, \mathcal{F}_{i}(w)=J_{i}(y(w)), i$ may equal any of the numbers $1,2,3,4, Z_{0}=$ const is given and

$$
\begin{align*}
& J_{1}(y(w))=\int_{\Omega(w)}\left(y(w)-z_{0}\right)^{2} d x,  \tag{1.1}\\
& J_{2}(y(w))=\int_{\Omega(w)}|\nabla y(w)|^{2} d x,  \tag{1.2}\\
& J_{3}(y(w))=\left.\int_{0}^{1} y(w)\right|_{\Gamma(w)} d x_{2},  \tag{1.3}\\
& J_{4}(y(w))=\int_{0}^{1}\left(\left.y(w)\right|_{\Gamma(w)}-z_{0}\right)^{2} d x_{2}, \tag{1.4}
\end{align*}
$$

where $y(w)$ denotes the solution of the following unilateral boundary value problem :

$$
\begin{gather*}
-\Delta y=f \quad \text { in } \Omega(w),  \tag{1.5}\\
y \geqq 0, \quad \frac{\partial y}{\partial v} \geqq 0, \quad y \frac{\partial y}{\partial v}=0 \quad \text { on } \Gamma(w), \\
y=0 \quad \text { on } \quad \partial \Omega(w)-\Gamma(w) .
\end{gather*}
$$

Here $f \in L^{2}\left(\Omega_{\beta}\right)$ is given, $\Omega_{\beta}=(0, \beta) \times(0,1)$ and $\partial y / \partial v$ denotes the derivative with respect to the outward normal to $\Gamma(w)$. In the following, we denote by $H^{k}(\Omega)$ the Sobolev space $W_{2}^{(k)}(\Omega)$ with the usual norm $\|\cdot\|_{k, \Omega} H^{0} \equiv L^{2}$, and by $|\cdot|_{k, \Omega}$ the seminorm generated by all derivatives of the $k$-th order.
It is well-known that the state problem (1.5) can be formulated in terms of a variational inequality, as follows :

$$
\begin{gathered}
K(w)=\left\{z \in H^{1}(\Omega(w)) \mid z=0 \text { on } \partial \Omega(w)-\Gamma(w),\right. \\
z \geqq 0 \text { on } \Gamma(w)\} ;
\end{gathered}
$$

find $y \in K(w)$ such that for any $z \in K(w)$

$$
\begin{equation*}
\int_{\Omega(w)} \nabla y \cdot \nabla(z-y) d x \geqq \int_{\Omega(w)} f(z-y) d x . \tag{1.6}
\end{equation*}
$$

The problem (1.6) has a unique solution for any $w \in \mathscr{U}_{a d}$.
We are going to prove the main result of the section, i.e.
Theorem 1 : The problem $\left(P_{2}\right)$ has at least one solution for any of the four cost functionals $\mathrm{J}_{\mathrm{v}}, i=1,2,3,4$.

Proof: Let us consider a minımızıng sequence $\left\{w_{n}\right\}, \mathscr{F}_{1}\left(w_{n}\right) \rightarrow \inf _{w \in \mathscr{U}_{a d}} J_{1}(w)$ for $n \rightarrow \infty$. Since the set $\mathscr{U}_{a d}$ is compact in $C([0,1])$, we may choose a subsequence, denoted again by $\left\{w_{n}\right\}$, such that $w_{n} \rightarrow v$ in $C([0,1])$. It is readily seen that $v \in \mathscr{U}_{a d}$. Let us denote by $\Omega=\Omega(v)$ the domain bounded by $\Gamma=\Gamma(v)$. For any positive integer $m$ let $G_{m}$ be the domain bounded by $\gamma_{m}$, where

$$
\gamma_{m}=\left\{\left(x_{1}, x_{2}\right) \left\lvert\, x_{1}=v\left(x_{2}\right)-\frac{1}{m}\right.\right\} .
$$

Furthermore, let $\Omega_{n}$ be the domain bounded by the graph of the function $w_{n}$ and $y_{n}$ the corresponding solution of the state problem (1.5) or (1.6), respectively, where $\Omega\left(w_{n}\right)=\Omega_{n}, \Gamma\left(w_{n}\right)=\Gamma_{n}$ and $K\left(w_{n}\right)$ is inserted.

Choosing $z=0$ and $z=2 y_{n}$ in (1.6), we obtain

$$
\begin{equation*}
\int_{\Omega_{n}}\left|\nabla y_{n}\right|^{2} d x=\int_{\Omega_{n}} f y_{n} d x \leqq\|f\|_{0, \Omega_{n}}\left\|y_{n}\right\|_{0, \Omega_{n}} \tag{1.7}
\end{equation*}
$$

By a standard argument, we may write

$$
\begin{equation*}
\left\|y_{n}\right\|_{0, \Omega_{n}}^{2} \leqq \beta^{2} \int_{\Omega_{n}}\left|\nabla y_{n}\right|^{2} d x \tag{1.8}
\end{equation*}
$$

Combining (1.7) and (1.8), we are led to the estimate

$$
\begin{equation*}
\left\|y_{n}\right\|_{1, \Omega_{n}} \leqq C_{0} \quad \forall n \tag{1.9}
\end{equation*}
$$

with $C_{0}$ independent of $n$.
Next let us consider a fixed domain $G_{m}$. There exists $n_{0}(m)$ such that

$$
n>n_{0}(m) \Rightarrow G_{m} \subset \Omega_{n} .
$$

Then

$$
\begin{equation*}
\left\|y_{n}\right\|_{1, G_{m}} \leqq\left\|y_{n}\right\|_{1, \Omega_{n}} \leqq C_{0} \quad \forall n \tag{1.10}
\end{equation*}
$$

Consequently, a subsequence $\left\{y_{n_{1}}\right\}$ exists such that

$$
y_{n_{1}} \rightarrow y^{(m)} \text { (weakly) in } H^{1}\left(G_{m}\right), \quad y^{(m)} \in H^{1}\left(G_{m}\right) .
$$

For $G_{m+1}$ we obtain a similar assertion, if we choose the proper subsequence $\left\{y_{n_{2}}\right\}$ of the sequence $\left\{y_{n_{1}}\right\}$, etc.

Consider the diagonal subsequence $\left\{y_{n}^{D}\right\}$ of all subsequences

$$
\left\{y_{n_{1}}\right\},\left\{y_{n_{2}}\right\}, \ldots .
$$

It is easy to prove that a function $y \in H^{1}(\Omega)$ exists such that

$$
\begin{equation*}
\left.y_{n}^{D} \rightarrow y\right|_{G_{m}}=y^{(m)} \tag{1.11}
\end{equation*}
$$

weakly in $H^{1}\left(G_{m}\right)$ holds for any $m>\alpha^{-1}$.
In fact, the existence of generalized derivatives $\partial y / \partial x_{\imath}$ follows from the definition of the Sobolev space. Moreover, we have

$$
\left\|y^{(m)}\right\|_{1, G_{m}} \leqq C_{0} \quad \forall m
$$

since any ball in $H^{1}\left(G_{m}\right)$ is weakly closed. Hence defining $y$ such that

$$
\left.y\right|_{G_{m}}=y^{(m)} \quad \forall m>\alpha^{-1}
$$

we obtain

$$
\|y\|_{1, \Omega}^{2}=\lim _{m \rightarrow \infty}\left\|y^{(m)}\right\|_{1, G_{m}}^{2} \leqq C_{0}^{2}<\infty .
$$

Lemma 1.1:The trace of $y$ on $\Gamma$ is non-negative.
Proof: Assume that $y<0$ on a set $M_{0} \subset \Gamma$, mes $M_{0}>0$. Let $M$ denote the projection of $M_{0}$ into the $x_{2}$-axis. Hence we have

$$
\left.\int_{M} y\right|_{\Gamma} d x_{2}=c_{0}<0
$$

Denote $\left.y\right|_{\gamma_{m}}=\eta_{m},\left.y\right|_{\Gamma}=\eta$,

$$
c_{m}=\int_{M} \eta_{m} d x_{2}
$$

and

$$
V_{m}=\left\{\left(x_{1}, x_{2}\right) \left\lvert\, v-\frac{1}{m}<x_{1}<v\right., x_{2} \in M\right\} .
$$

Then we have

$$
\begin{align*}
&\left|\int_{M}\left(\eta-\eta_{m}\right) d x_{2}\right|=\left|\int_{M} d x_{2} \int_{v-1 / m}^{v} \frac{\partial y}{\partial x_{1}}\left(\xi, x_{2}\right) d \xi\right|= \\
&=\left|\int_{V_{m}} \frac{\partial y}{\partial x_{1}} d x\right| \leqq\|y\|_{1, \Omega}\left(\text { mes } V_{m}\right)^{1 / 2}, \text { mes } V_{m}=\frac{1}{m} \operatorname{mes} M . \tag{1.12}
\end{align*}
$$

Consequently, $\lim c_{m}=c_{0}$ and it holds

$$
\begin{equation*}
c_{m} \leqq \frac{1}{2} c_{0} \tag{1.13}
\end{equation*}
$$

for sufficiently great $m$.

Let us denote $V_{n m}=\left\{\left(x_{1}, x_{2}\right) \in \Omega_{n}-G_{m}, x_{2} \in M\right\}$,

$$
d_{n}=\left.\int_{M} y_{n}^{D}\right|_{r_{n}} d x_{2} \geqq 0
$$

(since $\left.y_{n}^{D} \in K\left(w_{n}\right)\right)$ and

$$
d_{n m}=\left.\int_{M} y_{n}^{D}\right|_{\gamma_{m}} d x_{2}
$$

By the same argument as in (1 12) we obtain for $n \geqq n_{0}(m)$

$$
\left|\int_{M}\left(\left.y_{n}^{D}\right|_{\Gamma_{n}}-\left.y_{n}^{D}\right|_{\gamma_{m}}\right) d x_{2}\right| \leqq C_{0}\left(\operatorname{mes} V_{n m}\right)^{1 / 2}
$$

Since lim mes $V_{n m}=0$ for $n \rightarrow \infty, m \rightarrow \infty, n \geqq n_{0}(m)$,

$$
\begin{equation*}
d_{n m} \geqq \frac{1}{4} c_{0} \tag{array}
\end{equation*}
$$

follows for sufficiently great $n, m, n \geqq n_{0}(m)$
From the weak convergence $y_{n}^{D} \rightharpoonup y$ in $H^{1}\left(G_{m}\right)$ we deduce

$$
\lim _{n \rightarrow \infty} d_{n m}=\left.\lim _{n \rightarrow \infty} \int_{M} y_{n}^{D}\right|_{\gamma_{m}} d x_{2}=\int_{M} \eta_{m} d x_{2}=c_{m}
$$

By virtue of (1 14), we therefore have

$$
c_{m} \geqq \frac{1}{4} c_{0}
$$

for sufficiently great $m$, which is a contradiction with (113)
Lemma 12 The function $y$ belongs to $K(v)$ and satısfies the variational mequality (1 6) on $\Omega=\Omega(v)$

Proof (1) Let us consider an arbitrary $G_{m}$ and denote

$$
V\left(G_{m}\right)=\left\{z \in H^{1}\left(G_{m}\right) \mid z=0 \quad \text { on } \quad \partial G_{m}-\gamma_{m}\right\}
$$

Since $V\left(G_{m}\right)$ is weakly closed, $y^{(m)} \in V\left(G_{m}\right)$ follows from (111) Hence we have $y=0$ on $\partial \Omega-\Gamma$ and combining this result with Lemma 11 , we obtain $y \in K(v)$
(11) For any fixed $m$ we introduce the set

$$
M_{m}=\left\{\zeta \in H_{0}^{1}\left(\Omega_{\beta}\right) \mid \zeta=0 \quad \text { on } \quad \Omega_{\beta}-G_{m}\right\}
$$

R A IR O Analyse numerıque/Numerical Analysis

For any $n>n_{0}(m)$ and $z_{k} \in M_{m}$ it holds (we omit the superscript $D$ in what follows) :

$$
\begin{equation*}
\int_{\Omega_{n}} \nabla y_{n} \cdot \nabla\left(z_{k}-y_{n}\right) d x \geqq \int_{\Omega_{n}} f\left(z_{k}-y_{n}\right) d x \tag{1.15}
\end{equation*}
$$

since $z_{k} \geqq 0$ on $\Gamma_{n}$ and therefore $z_{k} \in K\left(w_{n}\right)$.
Let us pass to the limit for $n \rightarrow \infty$ in (1.15). We have

$$
\begin{aligned}
\int_{\Omega_{n}} \nabla y_{n} \cdot \nabla z_{k} d x= & \int_{G_{m}} \nabla y_{n} \cdot \nabla z_{k} d x+\int_{\Omega_{n}-\Omega} \nabla y_{n} \cdot \nabla z_{k} d x+ \\
& +\int_{\left(\Omega-G_{m}\right) \cap \Omega_{n}} \nabla y_{n} \cdot \nabla z_{k} d x, \\
& \lim _{n \rightarrow \infty} \int_{G_{m}} \nabla y_{n} \cdot \nabla z_{k} d x=\int_{G_{m}} \nabla y \cdot \nabla z_{k} d x, \\
& \lim _{n \rightarrow \infty} \int_{\Omega_{n}-\Omega} \nabla y_{n} \cdot \nabla z_{k} d x=0 .
\end{aligned}
$$

The last result follows from the estimate

$$
\left|\int_{\Omega_{n}-\Omega} \nabla y_{n} \cdot \nabla z_{k} d x\right| \leqq\left\|y_{n}\right\|_{1, \Omega_{n}}\left\|\nabla z_{k}\right\|_{0, \Omega_{n}-\Omega}
$$

using (1.9) and $\lim _{n \rightarrow \infty}\left[\operatorname{mes}\left(\Omega_{n}-\Omega\right)\right]=0$.
By a similar argument we obtain

$$
\left|\int_{\left(\Omega-G_{m}\right) \cap \Omega_{n}} \nabla y_{n} \cdot \nabla z_{k} d x\right| \leqq C_{0}\left|z_{k}\right|_{1, \Omega-G_{m}}
$$

Thus we may write

$$
\begin{equation*}
\lim _{n \rightarrow \infty} \sup \int_{\Omega_{n}} \nabla y_{n} \cdot \nabla z_{k} d x \leqq \int_{G_{m}} \nabla y \cdot \nabla z_{k} d x+C_{0}\left|z_{k}\right|_{1, \Omega-G_{m}} \tag{1.16}
\end{equation*}
$$

The same approach leads to the inequality

$$
\begin{equation*}
\lim _{n \rightarrow \infty} \inf \left(-\int_{\Omega_{n}} f y_{n} d x\right) \geqq-\int_{G_{m}} f y d x-C_{0}\|f\|_{0, \Omega-G_{m}} \tag{1.17}
\end{equation*}
$$

Moreover, we obtain

$$
\begin{equation*}
\lim _{n \rightarrow \infty} \int_{\Omega_{n}} f z_{k} d x=\int_{\Omega} f z_{k} d x \tag{array}
\end{equation*}
$$

The inequality (1 15 ) yields

$$
-\int_{G_{m}}\left|\nabla y_{n}\right|^{2} d x \geqq-\int_{\Omega_{n}} \nabla y_{n} \cdot \nabla z_{k} d x+\int_{\Omega_{n}} f\left(z_{k}-y_{n}\right) d x
$$

For $n \rightarrow \infty$ (and a proper subsequence) we deduce on the basis of (116), (1 17) and (1 18) that

$$
\begin{aligned}
-\int_{G_{m}}|\nabla y|^{2} d x & \geqq \lim _{n \rightarrow \infty}\left(-\int_{G_{m}}\left|\nabla y_{n}\right|^{2} d x\right) \\
& \geqq-\int_{G_{m}} \nabla y \cdot \nabla z_{k} d x-C_{0}\left|z_{k}\right|_{1 \Omega-G_{m}}+ \\
& +\int_{\Omega} f z_{k} d x-\int_{G_{m}} f v d x-C_{0}\|f\|_{0 \Omega-G_{m}}
\end{aligned}
$$

Consequently, we may write

$$
\begin{align*}
& \int_{G_{m}} \nabla y \cdot \nabla\left(z_{k}-y\right) d x \geqq \\
& \quad \geqq \int_{\Omega} f z_{k} d x-\int_{G_{m}} f y d x-C_{0}\left(\left|z_{k}\right|_{1 \Omega-G_{m}}+\|f\|_{0 \Omega-G_{m}}\right) \tag{array}
\end{align*}
$$

Let a $z \in K(v)$ be given There exists a function $\omega \in H^{1}\left(\Omega_{\beta}\right)$ such that $\omega=z$ on $\partial \Omega$ and $\omega \geqq 0$ ae in $\Omega_{\beta}$ Then $Z=z-\left.\omega\right|_{\Omega} \in H_{0}^{1}(\Omega)$ and therefore a sequence $\left\{Z_{k}\right\}, Z_{k} \in C_{0}^{\infty}(\Omega)$ exists such that if we define

$$
\left.z_{k}\right|_{\Omega}=\omega+Z_{k},\left.\quad z_{k}\right|_{\Omega_{\beta}-\Omega}=\omega,
$$

then it holds

$$
\begin{array}{r}
1 / m<d_{k} \equiv \operatorname{dist}\left(\Gamma, \operatorname{supp} Z_{k}\right) \Rightarrow z_{k} \in M_{m} \\
\left\|z_{k}-z\right\|_{1, \Omega}=\left\|Z_{k}-Z\right\|_{1 \Omega} \rightarrow 0 \text { for } k \rightarrow \infty
\end{array}
$$

Passing to the limit in (1-19) for $m \rightarrow \infty, k \rightarrow \infty, m>1 / d_{k}$, we obtain

$$
\left|z_{k}\right|_{1 \Omega-G_{m}}=|\omega|_{1 \Omega-G_{m}} \rightarrow 0
$$

$$
\begin{aligned}
&\left|\int_{G_{m}} \nabla y \cdot \nabla z_{k} d x-\int_{G_{m}} \nabla y \cdot \nabla z d x+\int_{G_{m}} \nabla y \cdot \nabla z d x-\int_{\Omega} \nabla y \cdot \nabla z d x\right| \leqq \\
& \leqq\left|\int_{G_{m}} \nabla y \cdot \nabla\left(z_{k}-z\right) d x\right|+\left|\int_{\Omega-G_{m}} \nabla y \cdot \nabla z d x\right| \\
& \leqq|y|_{1, \Omega}\left|z_{k}-z\right|_{1, \Omega}+\int_{\Omega-G_{m}}|\nabla y \cdot \nabla z| d x \rightarrow 0
\end{aligned}
$$

Thus we arrive at the inequality

$$
\int_{\Omega} \nabla y . \nabla z d x-\int_{\Omega}|\nabla y|^{2} d x \geqq \int_{\Omega} f z d x-\int_{\Omega} f y d x . \quad \text { Q.E.D. }
$$

Lemma 1.3 : For any $i=1,2,3,4$ there exists a subsequence of the minimizing sequence, denoted again by $\left\{w_{n}\right\}$, such that $w_{n} \rightarrow v$ in $C([0,1]), v \in \mathscr{U}_{a d}$ and

$$
\begin{equation*}
\lim _{n \rightarrow \infty} \mathscr{J}_{i}\left(w_{n}\right)=\mathcal{Y}_{i}(v) \equiv J_{i}(y(v)) \tag{1.20}
\end{equation*}
$$

Proof: Let $i=1$. For any $m>\alpha^{-1}$ it holds
$y_{1}\left(w_{n}\right)=\int_{G_{m}}\left(y_{n}-z_{0}\right)^{2} d x+\int_{\Omega_{n}-G_{m}}\left(y_{n}-z_{0}\right)^{2} d x \geqq \int_{G_{m}}\left(y_{n}-z_{0}\right)^{2} d x$.

Considering the subsequence $\left\{y_{n}^{D}\right\}$ and using (1.11), we obtain, by virtue of the Rellich's theorem

$$
\lim _{n \rightarrow \infty} y_{1}\left(w_{n}\right) \geqq \int_{G_{m}}\left(y-z_{0}\right)^{2} d x
$$

For $m \rightarrow \infty$ in the right-hand side we get

$$
\lim _{n \rightarrow \infty} y_{1}\left(w_{n}\right) \geqq \int_{\Omega}\left(y-z_{0}\right)^{2} d x
$$

Since $v \in \mathscr{U}_{a d}, y=y(v)$ on the basis of Lemma 1.2, and

$$
\begin{equation*}
\lim _{n \rightarrow \infty} \mathscr{f}_{1}\left(w_{n}\right)=\inf _{w \in \mathscr{U}_{a d}} \mathcal{F}_{1}(w) \tag{1.22}
\end{equation*}
$$

we have

$$
y_{1}(v)=\int_{\Omega}\left(y-z_{0}\right)^{2} d x \leqq \inf y_{1}(w) \Rightarrow \tilde{y}_{1}(v)=\inf y_{1}(w)
$$

From this and (1.22) we conclude that (1.20) holds.
Let $i=2$. For $m>\alpha^{-1}$ we have

$$
y_{2}\left(w_{n}\right) \geqq \int_{G_{m}}\left|\nabla y_{n}\right|^{2} d x
$$

Since the latter integral is a weakly lower semi-continuous functional on $H^{1}\left(G_{m}\right)$, considering the subsequence $\left\{y_{n}^{D}\right\}$, we may write

$$
\lim _{n \rightarrow \infty} \dot{\tilde{\gamma}}_{2}\left(w_{n}\right) \geqq \int_{G_{m}}|\nabla y|^{2} d x
$$

Passing to the limit for $m \rightarrow \infty$, we obtain

$$
\begin{equation*}
\inf _{w \in \mathscr{U}_{a d}} y_{2}(w) \geqq \int_{\Omega}|\nabla y|^{2} d x \tag{1.23}
\end{equation*}
$$

Using Lemma 1.2 we conclude that the equality takes place in (1.23) and (1.20) follows.

Let $i=3$. Using Lemma 1.2, we may write

$$
\begin{equation*}
y_{3}\left(w_{n}\right)-y_{3}(v)=\int_{0}^{1}\left(\left.y_{n}\right|_{\Gamma_{n}}-\left.y\right|_{\Gamma}\right) d x_{2}=I_{1}+I_{2}+I_{3} \tag{1.24}
\end{equation*}
$$

where

$$
\begin{gathered}
I_{1}=\int_{0}^{1}\left(\left.y_{n}\right|_{\Gamma_{n}}-\left.y_{n}\right|_{\gamma_{m}}\right) d x_{2}, \quad I_{2}=\int_{0}^{1}\left(\left.y_{n}\right|_{\gamma_{m}}-\left.y\right|_{\gamma_{m}}\right) d x_{2} \\
I_{3}=\int_{0}^{1}\left(\left.y\right|_{\gamma_{m}}-\left.y\right|_{\Gamma}\right) d x_{2}
\end{gathered}
$$

The following estimates hold :

$$
\begin{align*}
&\left|I_{1}\right|=\left|\int_{0}^{1} d x_{2} \int_{v-\frac{1}{m}}^{w_{n}} \frac{\partial y_{n}}{\partial x_{1}}\left(\xi, x_{2}\right) d \xi\right| \leqslant \\
& \leqslant\left(\frac{1}{m}+\beta_{n}\right)^{1 / 2} \int_{0}^{1} d x_{2}\left(\int_{v-\frac{1}{m}}^{w_{n}}\left(\frac{\partial y_{n}}{\partial x_{1}}\right)^{2} d \xi\right)^{1 / 2} \\
& \leqslant\left(\frac{1}{m}+\beta_{n}\right)^{1 / 2}\left[\int_{0}^{1} \int_{0}^{w_{n}}\left(\frac{\partial y_{n}}{\partial x_{1}}\right)^{2} d x_{1} d x_{2}\right]^{1 / 2} \\
& \leqslant\left(\frac{1}{m}+\beta_{n}\right)^{1 / 2}\left\|y_{n}\right\|_{1, \Omega_{n}} \tag{1.25}
\end{align*}
$$

where

$$
\begin{gather*}
\beta_{n}=\max _{x_{2} \in[0,1]}\left|w_{n}\left(x_{2}\right)-v\left(x_{2}\right)\right| ; \\
\lim _{n \rightarrow \infty} I_{2}=0 \tag{1.26}
\end{gather*}
$$

by virtue of (1.11); finally

$$
\begin{equation*}
\lim _{m \rightarrow \infty} I_{3}=0 \tag{1.27}
\end{equation*}
$$

follows from the argument of (1.12), applied to $M \equiv[0,1]$.
Combining (1.25), (1.9), (1.26), (1.27) and (1.24), we obtain (1.20).
Let $i=4$. We may write, using Lemma 1.2 :

$$
\begin{equation*}
\mathcal{F}_{4}\left(w_{n}\right)-\mathscr{g}_{4}(v)=K_{1}+K_{2}+K_{3} \tag{1.28}
\end{equation*}
$$

where

$$
\begin{aligned}
& K_{1}=\int_{0}^{1}\left(\left.y_{n}\right|_{\Gamma_{n}}-z_{0}\right)^{2} d x_{2}-\int_{0}^{1}\left(\left.y_{n}\right|_{\gamma_{m}}-z_{0}\right)^{2} d x_{2} \\
& K_{2}=\int_{0}^{1}\left(\left.y_{n}\right|_{\gamma_{m}}-z_{0}\right)^{2} d x_{2}-\int_{0}^{1}\left(\left.y\right|_{\gamma_{m}}-z_{0}\right)^{2} d x_{2} \\
& K_{3}=\int_{0}^{1}\left(\left.y\right|_{\gamma_{m}}-z_{0}\right)^{2} d x_{2}-\int_{0}^{1}\left(\left.y\right|_{\Gamma}-z_{0}\right)^{2} d x_{2}, \quad n>n_{0}(m) .
\end{aligned}
$$

Let us derive estimates for $K_{i}$. Thus we have

$$
\begin{align*}
& \left|K_{1}\right| \leqq \int_{0}^{1}\left|y_{n}\right|_{\Gamma_{n}}-\left.\left.y_{n}\right|_{\gamma_{m}}|\cdot| y_{n}\right|_{\Gamma_{n}}+\left.y_{n}\right|_{\gamma_{m}}-2 z_{0} \mid d x_{2} \leqq \\
& \leqq\left[\int_{0}^{1}\left(\left.y_{n}\right|_{\Gamma_{n}}-\left.y_{n}\right|_{\gamma_{m}}\right)^{2} d x_{2}\right]^{1 / 2}\left[\int_{0}^{1}\left(\left.y_{n}\right|_{\Gamma_{n}}+\left.y_{n}\right|_{\gamma_{m}}-2 z_{0}\right)^{2} d x_{2}\right]^{1 / 2}  \tag{1.29}\\
& \int_{0}^{1}\left(\left.y_{n}\right|_{\Gamma_{n}}-\left.y_{n}\right|_{\gamma_{m}}\right)^{2} d x_{2}=\int_{0}^{1} d x_{2}\left(\int_{v-\frac{1}{m}}^{w_{n}} \frac{\partial y_{n}}{\partial x_{1}} d x_{1}\right)^{2} \leqq \\
& \quad \leqq\left(\frac{1}{m}+\beta_{n}\right) \int_{0}^{1} d x_{2} \int_{v-\frac{1}{m}}^{w_{n}}\left(\frac{\partial y_{n}}{\partial x_{1}}\right)^{2} d x_{1} \leqq\left(\frac{1}{m}+\beta_{n}\right)\left\|y_{n}\right\|_{1, \Omega_{n}}^{2}  \tag{1.30}\\
& \begin{array}{l}
\int_{0}^{1}\left(\left.y_{n}\right|_{\Gamma_{n}}+\left.y_{n}\right|_{\gamma_{m}}-2 z_{0}\right)^{2} d x_{2} \leqq \\
\leqq 3 \int_{0}^{1}\left[\left(\left.y_{n}\right|_{\Gamma_{n}}\right)^{2}+\left(\left.y_{n}\right|_{\gamma_{m}}\right)^{2}+4 z_{0}^{2}\right] d x_{2} \leqq C
\end{array}
\end{align*}
$$

where $C$ is independent of all sufficiently great $n, m, n>n_{0}(m)$. Indeed,

$$
\int_{0}^{1}\left(\left.y_{n}\right|_{\Gamma_{n}}\right)^{2} d x_{2} \leqq 2\left[\int_{0}^{1}\left(\left.y_{n}\right|_{\Gamma_{n}}-z_{0}\right)^{2} d x_{2}+\int_{0}^{1} z_{0}^{2} d x_{2}\right] \leqq C_{4}
$$

since $y_{n}$ generate a minımizing sequence $J_{4}\left(y_{n}\right)$. Furthermore, using (1.30), we may write

$$
\begin{aligned}
\int_{0}^{1}\left(\left.y_{n}\right|_{\gamma_{m}}\right)^{2} d x_{2} & \leqq \\
& \leqq 2\left(\int_{0}^{1}\left(\left.y_{n}\right|_{\Gamma_{n}}\right)^{2} d x_{2}+\int_{0}^{1}\left(\left.y_{n}\right|_{\gamma_{m}}-\left.y_{n}\right|_{\Gamma_{n}}\right)^{2} d x_{2}\right) \leqq 2 C_{4}+C_{5}
\end{aligned}
$$

and we arrive at (1.31).
Consequently,

$$
\begin{equation*}
\lim K_{1}=0 \quad \text { for } n \rightarrow \infty, m \rightarrow \infty, n>n_{0}(m) \tag{1.32}
\end{equation*}
$$

follows from (1.29), (1.30), (1.31) and (1.9).
Since the integral

$$
K_{0}(\eta) \equiv \int_{0}^{1}\left(\left.\eta\right|_{\gamma_{m}}-z_{0}\right)^{2} d x_{2}
$$

is a weakly lower semi-continuous functional in $H^{1}\left(G_{m}\right)$, we have for any $m>\alpha^{-1}$

$$
\begin{equation*}
\lim _{n \rightarrow \infty} \inf K_{2} \geqq 0 \tag{1.33}
\end{equation*}
$$

Finally,

$$
\begin{align*}
& \left|K_{3}\right|=\left|\int_{0}^{1}\left(\left.y\right|_{\gamma_{m}}-\left.y\right|_{\Gamma}\right)\left(\left.y\right|_{\gamma_{m}}+\left.y\right|_{\Gamma}-2 z_{0}\right) d x_{2}\right| \leqq \\
& \tag{1.34}
\end{align*}
$$

follows from Theorem 4.6 in chapter 2 of the book [3].
Using (1.28), (1.32), (1.33) and (1.34), we obtain

$$
\lim _{n \rightarrow \infty}\left(\mathscr{f}_{4}\left(w_{n}\right)-\mathfrak{g}_{4}(v)\right) \geqq 0
$$

for a subsequence $\left\{w_{n}\right\}$.

Hence

$$
\gamma_{4}(v) \leqq \lim \gamma_{4}\left(w_{n}\right)=\inf _{\mathscr{U}_{a d}} \gamma_{4}(w)
$$

and only the equality sign may take place, since $v \in \mathscr{U}_{a d} \quad$ Q.E.D.
Theorem 1 is now an easy consequence of Lemma 1.3 and of the equation

$$
\lim _{n \rightarrow \infty} \mathcal{F}_{l}\left(w_{n}\right)=\inf _{w \in \mathscr{U}_{a d}} \mathscr{F}_{l}(w)
$$

## 2. APPROXIMATE SOLUTION BY FINITE ELEMENTS

The problems $\left(P_{\imath}\right)$ have to be solved approximately. To this end we follow the approach of Begis and Glowinski [2], transforming each of the problems $\left(P_{t}\right)$ into an equivalent one with the state problem defined on a fixed square domain and then employing bilinear finite elements on a uniform mesh. The unknown part of the boundary is sought among continuous piecewise linear functions.

Thus let $N$ be a positive integer and $h=1 / N$. Denote by $e_{\rho}, j=1, \ldots, N$, the interval $[(j-1) h, j h]$ and introduce the set

$$
\mathscr{U}_{a d}^{h}=\left\{w_{h} \in \mathscr{U}_{a d}\left|w_{h}\right|_{e_{j}} \in P_{1} \quad \forall j\right\}
$$

where $P_{1}$ denotes the space of linear polynomials.
Let $\Omega_{h}$ denote the domain bounded by the graph $\Gamma_{h}$ of the function $w_{h} \in \mathscr{U}_{a d}^{h}$, i.e. $\Omega_{h} \equiv \Omega\left(w_{h}\right)$.

We define : $\hat{\Omega}=(0,1) \times(0,1)$,

$$
\begin{gather*}
\hat{K}_{\imath j}=[(i-1) h, i h] \times[(j-1) h, j h], \\
\hat{\mathscr{K}}_{h}=\left\{\hat{K}_{t j}\right\}_{t, j=1}^{N}, \\
F_{h}: \hat{\Omega} \rightarrow \Omega_{h}, \quad F_{h}=\left(F_{1 h}, F_{2 h}\right),  \tag{array}\\
F_{1 h}\left(\hat{x}_{1}, \hat{x}_{2}\right)=\hat{x}_{1} w_{h}\left(\hat{x}_{2}\right), \quad F_{2 h}\left(\hat{x}_{1}, \hat{x}_{2}\right)=\hat{x}_{2}, \\
K_{\imath j}=F_{h}\left(\hat{K}_{\imath \jmath}\right) \quad \forall i, j, \quad \mathscr{K}_{h}=\left\{K_{\imath j}\right\}_{t, j=1}^{N} .
\end{gather*}
$$

Note that each $K_{\imath j}$ is a trapezoid and

$$
\left.F_{h}\right|_{K_{1},} \in Q_{1} \times Q_{1},
$$

where $Q_{1}=\left\{p \mid p=p\left(\hat{x}_{1}, \hat{x}_{2}\right)=a_{00}+a_{10} \hat{x}_{1}+a_{01} \hat{x}_{2}+a_{11} \hat{x}_{1} \hat{x}_{2}\right\}$ denotes the space of bilinear polynomials.

Let us consider the problem (1.6) on the domain $\Omega_{h}$. To approximate $K\left(w_{h}\right)$ we introduce the set

$$
K_{h}=\left\{z_{h}\left|z_{h} \in K\left(w_{h}\right) \cap C\left(\bar{\Omega}_{h}\right), z_{h} \circ F_{h}\right|_{\hat{\mathbf{K}}_{\imath j}} \in Q_{1} \quad \forall l, J\right\}
$$

Let us define the finite element approximations of (1.6) as the solution $y_{h} \in K_{h}$ of (1.6) on $\Omega_{h}$ for any $z_{h} \in K_{h}$. Instead of (1.6), however, it is more suitable to solve numerically an equivalent problem on $\hat{\Omega}$, which is obtained by the transformation (2.1) of the integrals in (1.6). Thus we arrive at the inequality

$$
\begin{equation*}
a\left(w_{h} ; \hat{y}_{h}, \hat{z}_{h}-\hat{y}_{h}\right) \geqq L\left(w_{h} ; \hat{z}_{h}-\hat{y}_{h}\right) \quad \forall \hat{z}_{h} \in \hat{K}_{h}, \tag{2.2}
\end{equation*}
$$

where

$$
\begin{gathered}
\hat{y}_{h}=y_{h} \circ F_{h} \in \hat{K}_{h}, \\
a\left(w_{h} ; \hat{y}_{h}, \hat{t}_{h}\right)=\int_{\hat{\Omega}}\left[\frac{1}{w_{h}^{2}} \frac{\partial \hat{y}_{h}}{\partial x_{1}} \frac{\partial \hat{t}_{h}}{\partial x_{1}}+\left(\hat{x}_{1} \frac{w_{h}^{\prime}}{w_{h}} \frac{\partial \hat{y}_{h}}{\partial \hat{x}_{1}}-\frac{\partial \hat{y}_{h}}{\partial \hat{x}_{2}}\right) \cdot\right. \\
\left.\cdot\left(\hat{x}_{1} \frac{w_{h}^{\prime}}{w_{h}} \frac{\partial \hat{t}_{h}}{\partial \hat{x}_{1}}-\frac{\partial \hat{t}_{h}}{\partial \hat{x}_{2}}\right)\right] w_{h} d \hat{x}, \quad w_{h}^{\prime}=d w_{h} / d x_{2}, \\
L\left(w_{h} ; \hat{t}_{h}\right)=\int_{\hat{\Omega}} \hat{f t}_{h} w_{h} d \hat{x}, \hat{f}=f \circ F_{h}, \\
\hat{K}_{h}=\left\{\hat{z}_{h}\left|\hat{z}_{h} \in C(\overline{\hat{\Omega}}), \hat{z}_{h}\right| \hat{K}_{1} \in Q_{1} \forall i, j, \quad \hat{z}_{h} \geqq 0 \text { on } \hat{\Gamma}, \quad z_{h}=0 \text { on } \partial \hat{\Omega}-\hat{\Gamma}\right\}, \\
\hat{\Gamma}=\left\{\left(\hat{x}_{1}, \hat{x}_{2}\right) \mid \hat{x}_{1}=1,0 \leqq \hat{x}_{2} \leqq 1\right\} .
\end{gathered}
$$

To simplify further the calculations, we introduce approximate forms $a_{h}$ and $L_{h}$, as follows :

$$
\begin{aligned}
a_{h}\left(w_{h} ; \hat{y}_{h}, \hat{t}_{h}\right)= & \sum_{i, j=1}^{N} \int_{\hat{K}_{1}}\left[\frac{1}{w_{h}^{2}\left(\xi_{j}\right)} \frac{\partial \hat{y}_{h}}{\partial \hat{x}_{1}} \frac{\partial \hat{t}_{h}}{\partial \hat{x}_{1}}+\right. \\
& \left.+\left(\xi_{t} \frac{w_{h}^{\prime}}{w_{h}\left(\xi_{J}\right)} \frac{\partial \hat{y}_{h}}{\partial \hat{x}_{1}}-\frac{\partial \hat{y}_{h}}{\partial \hat{x}_{2}}\right)\left(\xi_{i} \frac{w_{h}^{\prime}}{w_{h}\left(\xi_{j}\right)} \frac{\partial \hat{t}_{h}}{\partial \hat{x}_{1}}-\frac{\partial \hat{t}_{h}}{\partial \hat{x}_{2}}\right)\right] \cdot w_{h}\left(\xi_{J}\right) d \hat{x}
\end{aligned}
$$

where

$$
\begin{gathered}
\xi_{\imath}=\left(i-\frac{1}{2}\right) h, \quad \xi_{J}=\left(j-\frac{1}{2}\right) h, \\
L_{h}\left(w_{h} ; \hat{t}_{h}\right)=\frac{h^{2}}{4} \sum_{\imath, j=1}^{N} w_{h}\left(\xi_{J}\right) \sum_{k=1}^{4} \hat{f}\left(P_{\imath \jmath}^{k}\right) \hat{t}_{h}\left(P_{\imath \jmath}^{k}\right),
\end{gathered}
$$

where $P_{i j}^{h} k=1, \ldots, 4$, are the vertices of $\hat{K}_{i j}\left({ }^{1}\right)$.
( ${ }^{1}$ ) In case that $f$ is not contınuous, we replace $f\left(P_{t j}^{k}\right)$ by the mean value of $\dot{f}$ over the set

$$
\mathcal{O}\left(P_{t \jmath}^{k}\right) \equiv \hat{\Omega} \cap\left\{\left|\hat{x}_{r}-\left(P_{t}^{k}\right)_{r}\right|<\frac{1}{2} h, r=1,2\right\}
$$

R A I R O Analyse numerıque/Numerical Analysis

We replace (2.2) by the inequality

$$
\begin{equation*}
a_{h}\left(w_{h} ; \hat{y}_{h}, \hat{z}_{h}-\hat{y}_{h}\right) \geqq L_{h}\left(w_{h} ; \hat{z}_{h}-\hat{y}_{h}\right) \quad \forall \hat{z}_{h} \in \hat{K}_{h} . \tag{2.3}
\end{equation*}
$$

Moreover, the cost functionals $\mathscr{F}_{\imath}$ will be replaced by the approximate functionals :

$$
\begin{align*}
& y_{1 h}\left(w_{h}\right)=J_{1 h}\left(w_{h} ; \hat{y}_{h}\right)=\frac{h^{2}}{4} \sum_{t, j=1}^{N} w_{h}\left(\xi_{J}\right) \sum_{k=1}^{4}\left(\hat{y}_{h}\left(P_{\imath J}^{k}\right)-z_{0}\right)^{2},  \tag{2.4}\\
& y_{2 h}\left(w_{h}\right)=J_{2 h}\left(w_{h} ; \hat{y}_{h}\right)=a_{h}\left(w_{h} ; \hat{y}_{h}, \hat{y}_{h}\right), \\
& y_{3 h}\left(w_{h}\right)=J_{3 h}\left(w_{h} ; \hat{y}_{h}\right)=h \sum_{J=1}^{N} \hat{y}_{h}\left(1, \xi_{J}\right) .
\end{align*}
$$

Note that among the functionals $y_{1}$ only $y_{3}$ is integrated without loss of accuracy, i.e.

$$
y_{3 h}\left(w^{h}\right)=J_{3}\left(y_{h}\right)=\int_{0}^{1} \hat{y}_{h}\left(1, \hat{x}_{2}\right) d \hat{x}_{2}=\left.\int_{0}^{1} y_{h}\right|_{\Gamma_{h}} d x_{2} .
$$

We then solve the problem :
$\left(P_{\iota h}\right) \quad \tilde{y}_{t h}\left(v_{h}\right)=\min _{w_{h} \in \mathscr{U}_{a d}} \mathscr{y}_{\iota h}\left(w_{h}\right), \quad \iota=1,2,3$,
where $\gamma_{i h}$ are defined by means of the formulae (2.4) and $\hat{y}_{h} \in \hat{K}_{h}$ are solutions of (2.3).

## 3. CONVERGENCE OF FINITE ELEMENT APPROXIMATIONS

We are going to show that a subsequence $\left\{u_{h}\right\}$ of the approximate solutions exists, which converges in some sense to a solution of the continuous problem $\left(P_{t}\right), \imath=1,2,3$. In several points of the argument we use the results of Begis and Glowinski [1].

First we prove an important lemma.
Lemma 3.1: Suppose that $f \in C^{1}\left(\bar{\Omega}_{\beta}\right)$ and a sequence $\left\{v_{h}\right\}$, $v_{h} \in \mathscr{U}_{a d}^{h}$, converges uniformly to a function $v$. Let $\hat{y}_{h}$ be the solution of the inequality (2.3) for $w_{h} \equiv v_{h}$ and $y_{h}=\hat{y}_{h} \circ F_{h}^{-1}$. Moreover, let $y(v)$ be the solution of the problem (1.6) for $w \equiv v$ on the domain $\Omega \equiv \Omega(v)$.

Then for any integer $m>\alpha^{-1}$ a subsequence $\left\{y_{h}\right\}$ exists such that

$$
\begin{equation*}
y_{h} \rightarrow y(v)(\text { weakly }) \text { in } H^{1}\left(G_{m}\right), \tag{3.1}
\end{equation*}
$$

where

$$
G_{m}=\left\{\left(x_{1}, x_{2}\right) \left\lvert\, 0<x_{1}<v\left(x_{2}\right)-\frac{1}{m}\right., 0<x_{2}<1\right\} .
$$

vol $16, n^{\circ} 4,1982$

Proof : First let us show that (2.3) has a unique solution. In fact, one can derive that (see [1], Proposition 6.1)

$$
\begin{equation*}
a_{h}\left(w_{h} ; \hat{z}_{h}, \hat{z}_{h}\right) \geqq \frac{\alpha}{1+\beta^{2}+C_{1}^{2}}\left|\hat{z}_{h}\right|_{1, \hat{\Omega}}^{2} \quad \forall h, \forall w_{h} \in \mathscr{U}_{a d}^{h}, \forall \hat{z}_{h} \in H^{1}(\hat{\Omega}) . \tag{3.2}
\end{equation*}
$$

Since the set $\hat{K}_{h}$ is convex, the inequality (2.3) is equivalent with the problem of minimizing the functional

$$
I_{h}\left(\hat{z}_{h}\right)=\frac{1}{2} a_{h}\left(w_{h} ; \hat{z}_{h}, \hat{z}_{h}\right)-L_{h}\left(w_{h} ; \hat{z}_{h}\right)
$$

over the set $\hat{K}_{h}$. From (3.2), (3.5) and the Friedrichs inequality

$$
\begin{equation*}
\left\|\hat{z}_{h}\right\|_{0, \hat{\Omega}} \leqq C\left|\hat{z}_{h}\right|_{1, \hat{\Omega}} \forall \hat{z}_{h} \in H^{1}(\hat{\Omega}) \text { such that } \hat{z}_{h}\left(0, \hat{x}_{2}\right)=0 \tag{3.3}
\end{equation*}
$$

we conclude that $I_{h}$ is coercive on $\hat{K}_{h}$ and convex. Using also its continuity and the closedness of $\hat{K}_{h}$, the existence of a solution follows. The uniqueness is a consequence of (3.2) and the Friedrichs inequality.

Let us insert $\hat{z}_{h}=0$ and $\hat{z}_{h}=2 \hat{y}_{h}$ into (2.3), respectively. Thus we obtain

$$
\begin{equation*}
a_{h}\left(v_{h} ; \hat{y}_{h}, \hat{y}_{h}\right)=L_{h}\left(v_{h} ; \hat{y}_{h}\right) . \tag{3.4}
\end{equation*}
$$

It is easy to show that if $\hat{f} \in C(\overline{\hat{\Omega}})$, then

$$
\begin{equation*}
\left|L_{h}\left(v_{h}, \hat{y}_{h}\right)\right| \leqq \beta\|\hat{f}\|_{C}\left\|\hat{y}_{h}\right\|_{0, \Omega} . \tag{3.5}
\end{equation*}
$$

Using (3.2), (3.4), (3.5) and (3.3), we obtain

$$
\begin{equation*}
\left|\hat{y}_{h}\right|_{1, \hat{\Omega}} \leqq C \quad \forall h \tag{3.6}
\end{equation*}
$$

Since it holds for any $h>0$

$$
\begin{equation*}
C_{0}\left|y_{h}\right|_{1, \Omega_{h}}^{2} \leqq\left|\hat{y}_{h}\right|_{1, \hat{\Omega}}^{2} \leqq C_{2}\left|y_{h}\right|_{1, \Omega_{h}}^{2} \tag{3.7}
\end{equation*}
$$

(see [1], Proposition 5.1), we may also write

$$
\left|y_{h}\right|_{1, \Omega_{h}}^{2} \leqq C \quad \forall h
$$

The Friedrichs inequality in $\Omega_{h}$ yields

$$
\begin{equation*}
\left\|y_{h}\right\|_{1, \Omega_{h}}^{2} \leqq C \quad \forall h \tag{3.8}
\end{equation*}
$$

where $C$ is independent of $h$.

Arguing as in the proof of Theorem 1, we deduce that a subsequence of $\left\{y_{h}\right\}$, which will be denoted by the same symbol, and a function $y^{0} \in H^{1}(\Omega)$ exist such that for any $m>\alpha^{-1}$

$$
\begin{equation*}
\left.y_{h} \rightarrow y^{0}\right|_{G_{m}} \text { in } H^{1}\left(G_{m}\right) \quad \text { (weakly) } \tag{39}
\end{equation*}
$$

The same argument as the proof of Lemma 11 leads to the conclusion that the trace of $v^{0}$ on $\Gamma=\Gamma(v)$ is non-negative

Let us show that $y^{0}=y(v)$, e $y^{0}$ satisfies the inequality (16) on $\Omega=\Omega(v)$ and $y^{0} \in K(v)$ The latter assertion follows from the closedness of $V\left(G_{m}\right)$ (see the proof of Lemma $12(1))$ and (39) It remains to prove (16)

Let $z \in K(v)$ A function $w \in H^{1}\left(\Omega_{\beta}\right)$ exists such that

$$
\begin{array}{ll}
w=z & \text { on } \partial \Omega, \quad w=0 \quad \text { on } \quad \partial \Omega_{\beta}, \\
\mathrm{w} \geqq 0 & \text { ae } \text { in } \Omega_{\beta}
\end{array}
$$

Extending $w$ by zero outside $\Omega_{\beta}$, shrınking and regularızing, we obtain functions $R_{\mathscr{H}} w$ such that

$$
\begin{aligned}
& R_{\mathscr{H}} w \in C_{0}^{\infty}\left(\Omega_{\beta}\right), \quad R_{\mathscr{H}} w \geqq 0 \text { in } \Omega_{\beta}, \\
& \left\|R_{\mathscr{H}} w-w\right\|_{1 \Omega_{\beta}} \rightarrow 0 \text { for } \mathscr{H} \rightarrow 0
\end{aligned}
$$

Then $Z \equiv z-w \in H_{0}^{1}(\Omega)$ and therefore functions $Z_{k} \in C_{0}^{\infty}(\Omega)$ exist such that

$$
\left\|Z_{k}-Z\right\|_{1 \Omega} \rightarrow 0 \text { for } k \rightarrow \infty
$$

Let us define functions $\oplus_{k}^{*}$ in $\Omega_{\beta}$ such that

$$
\begin{aligned}
& \oplus_{k}^{\mathscr{H}}=\left.R_{\mathscr{H}} w\right|_{\Omega}+Z_{k} \text { in } \Omega, \\
& \varphi_{k}^{\mathscr{H}}=R_{\mathscr{H}} w \text { in } \Omega_{\beta}-\Omega
\end{aligned}
$$

Then obviously

$$
\begin{align*}
& \oplus_{k}^{\mathscr{H}} \geqq 0 \quad \text { in } \Omega_{\beta}-G_{m}, \quad \text { if } 1 / m<d_{k}=\operatorname{dist}\left(\Gamma, \text { supp } Z_{k}\right),  \tag{array}\\
& \left\|\oplus_{k}^{\mathscr{H}}-z\right\|_{1 \Omega}=\left\|R_{\mathscr{H}} w+Z_{k}-Z-w\right\|_{1 \Omega} \leqq \\
& \leqq\left\|R_{\mathscr{H}} w-w\right\|_{1 \Omega}+\left\|Z_{k}-Z\right\|_{1 \Omega} \rightarrow 0 \text { for } \mathscr{H} \rightarrow 0, k \rightarrow \infty \tag{array}
\end{align*}
$$

Next let $\varphi_{h}$ be the interpolate of $\oplus_{k}^{\mathscr{K}}$ on the mesh $\mathscr{K}_{h}$, e a function such that

$$
\begin{gathered}
\oplus_{h}(P)=\oplus_{k}^{\mathscr{H}}(P) \text { at all nodes of the mesh } \mathscr{K}_{h}, \\
\left.\oplus_{h} \circ F_{h}\right|_{K_{1 J}} \in Q_{1} \quad \forall i, j
\end{gathered}
$$

vol $16, n^{\circ} 4,1982$

It is readily seen that $\varphi_{h} \in K_{h}$ for sufficiently small $h$, since $\Gamma_{h} \subset \Omega_{\beta}-G_{m}$ holds for such $h$.

From the regularity of the family $\left\{\mathscr{K}_{h}\right\}, 0<h<1$ of meshes (see [1], Lemma 7.2) it follows (see [2]) that

$$
\begin{equation*}
\left\|\varphi_{h}-\varphi_{k}^{\mathscr{H}}\right\|_{1, \Omega_{h}} \leqq C h\left\|\varphi_{k}^{\mathscr{H}}\right\|_{2, \Omega_{\mathrm{B}}} . \tag{3.12}
\end{equation*}
$$

Next let us estimate the difference

$$
\begin{aligned}
& \left|L_{h}\left(v_{h} ; \hat{z}_{h}\right)-\int_{\hat{\Omega}} v_{h} \hat{f} \hat{z}_{h} d \hat{x}\right| \leqq \\
& \quad \leqq \sum_{i, j=1}^{N}\left|v_{h}\left(\xi_{J}\right) \sum_{k=1}^{4} \frac{h^{2}}{4} \mathscr{F}\left(P_{\imath J}^{k}\right)-\int_{\hat{K}_{l J}} v_{h}\left(\hat{x}_{2}\right) \mathscr{F} d \hat{x}\right| \\
& \quad \leqq \sum_{i, j=1}^{N}\left[\int_{\hat{K}_{⿺ J}}\left|g_{h} \mathscr{F}-\mathscr{F}\right| v_{h}\left(\xi_{J}\right) d \hat{x}+\int_{\hat{K}_{\imath_{J}}}|\mathscr{F}|\left|v_{h}\left(\xi_{J}\right)-v_{h}\left(\hat{x}_{2}\right)\right| d \hat{x}\right]
\end{aligned}
$$

where $\mathscr{F} \equiv \hat{f}_{\hat{z}_{h}}$ and $g_{h} \mathscr{F}$ is the piecewise constant function, equal to $\mathscr{F}\left(P_{t J}^{k}\right)$ over each of the subdomain $\mathcal{O}\left(P_{t \jmath}^{k}\right)$. Since

$$
\begin{equation*}
\left|g_{h} \mathscr{F}-\mathscr{F}\right| \leqq C h|\nabla \mathscr{F}|, \quad\left|v_{h}\left(\xi_{j}\right)-v_{h}\left(\hat{x}_{2}\right)\right| \leqq C_{1} h / 2, \tag{3.12}
\end{equation*}
$$

and

$$
\begin{gathered}
\|\nabla \mathscr{F}\|_{0, \hat{\Omega}} \leqq C\|\hat{f}\|_{C^{1}(\bar{\Omega}}, i \hat{z}_{h} \|_{1, \hat{\Omega}}, \\
\left.\|\mathscr{F}\|_{0, \hat{\Omega}} \leqq\|f\|_{C^{1}\left(\Omega_{D}\right)}\right) z_{h} \|_{0, \hat{\Omega}},
\end{gathered}
$$

we obtain, using also (3.3),

$$
\begin{gather*}
\left|L_{h}\left(v_{h}, \hat{z}_{h}\right)-\int_{\hat{\Omega}} v_{h} \hat{f} \hat{z}_{h} d \hat{x}\right| \leqq C h\|\hat{f}\|_{\left(\bar{C}_{1} \bar{\Omega}_{B}\right)}\left|\hat{z}_{h}\right|_{1, \hat{\Omega}}  \tag{3.13}\\
\forall \hat{z}_{h} \in H^{1}(\hat{\Omega}), \hat{z}_{h}\left(0, \hat{x}_{2}\right)=0 .
\end{gather*}
$$

An analogous argument yields

$$
\begin{align*}
& \left|a_{h}\left(v_{h} ; \hat{y}_{h}, \hat{z}_{h}\right)-a\left(v_{h} ; \hat{y}_{h}, \hat{z}_{h}\right)\right| \leqq C h\left|\hat{y}_{h}\right|_{1, \hat{\Omega}}\left|\hat{z}_{h}\right|_{1, \hat{\Omega}}  \tag{3.14}\\
& \forall \hat{y}_{h}, \hat{z}_{h} \in H^{1}(\hat{\Omega}) \quad \text { such that } \quad \hat{y}_{h}\left(0, \hat{x}_{2}\right)=\hat{z}_{h}\left(0, \hat{x}_{2}\right)=0 .
\end{align*}
$$

Since $\hat{\varphi}_{h}=\oplus_{h} \circ F_{h} \in \hat{K}_{h}$, we have

$$
\begin{gather*}
a_{h}\left(v_{h} ; \hat{y}_{h}, \hat{\varphi}_{h}-\hat{y}_{h}\right) \geqq L_{h}\left(v_{h} ; \hat{\varphi}_{h}-\hat{y}_{h}\right),  \tag{3.15}\\
a\left(v_{h} ; \hat{y}_{h}, \hat{\varphi}_{h}-\hat{y}_{h}\right)=\int_{\Omega_{h}} \nabla y_{h} \cdot \nabla\left(\varphi_{h}-y_{h}\right) d x . \tag{3.16}
\end{gather*}
$$

Therefore we may write

$$
\begin{align*}
& \int_{\Omega_{h}} \nabla y_{h} \cdot \nabla\left(\oplus_{h}-y_{h}\right) d x=a_{h}\left(v_{h}, \hat{y}_{h}, \hat{\oplus}_{h}-\hat{y}_{h}\right)+ \\
& \quad+\left[a\left(v_{h}, \hat{y}_{h}, \hat{\oplus}_{h}-\hat{y}_{h}\right)-a_{h}\left(v_{h}, \hat{y}_{h}, \hat{\oplus}_{h}-\hat{v}_{h}\right] \geqq\right. \\
& \quad \geqq \int_{\Omega_{h}} f\left(\oplus_{h}-y_{h}\right) d x+\left[L_{h}\left(v_{h}, \hat{\oplus}_{h}-\hat{y}_{h}\right)-\int_{\Omega} v_{h} \hat{f}\left(\hat{\oplus}_{h}-\hat{y}_{h}\right) d \hat{x}\right]+ \\
& \quad+\left[a\left(v_{h}, \hat{v}_{h}, \hat{\oplus}_{h}-\hat{y}_{h}\right)-a_{h}\left(v_{h}, \hat{y}_{h}, \hat{\oplus}_{h}-\hat{y}_{h}\right)\right] \tag{array}
\end{align*}
$$

Passing to the limit with $h \rightarrow 0$, we obtain for any $m>\alpha^{-1}$

$$
\begin{equation*}
\int_{G_{m}} \nabla y_{h} \cdot \nabla \varphi_{h} d x \rightarrow \int_{G_{m}} \nabla y^{0} \cdot \nabla \varphi_{k}^{\mathscr{H}} d x \tag{array}
\end{equation*}
$$

by virtue of (39) and (312), furthermore

$$
\begin{align*}
&\left|\int_{\Omega_{h} \Omega} \nabla y_{h} \cdot \nabla \varphi_{h} d x\right| \leqq\left|y_{h}\right|_{1 \Omega_{h}} \cdot\left|\varphi_{h}\right|_{1 \Omega_{h}-\Omega} \leqq \\
& \leqq C\left\|R_{\mathscr{H}} w\right\|_{C^{1}\left(\bar{\Omega}_{\beta}\right)}\left(\operatorname{mes}\left(\Omega_{h}-\Omega\right)\right)^{1 / 2} \tag{array}
\end{align*}
$$

since it is readily seen that in $\Omega_{h}-\Omega$ we have

$$
\left|\frac{\partial \varphi_{h}}{\partial x_{r}}\right| \leqq \max _{\bar{\Omega}_{\beta}}\left|\frac{\partial R_{\mathscr{H}} w}{\partial x_{r}}\right| \leqq\left\|R_{\mathscr{H}} w\right\|_{C^{1}\left(\bar{\Omega}_{\mathrm{p}}\right)}, \quad r=1,2
$$

Finally, we can write for $m>1 / d_{k}$

$$
\begin{align*}
\left|\int_{\left(\Omega-G_{m}\right) \cap \Omega_{h}} \nabla y_{h} \cdot \nabla \varphi_{h} d x\right| \leqq C\left|\omega_{h}\right|_{1 \Omega-G_{m}} & \leqq \\
& \leqq C(1 / m)^{1 / 2}\left\|R_{\mathscr{H}} w\right\|_{C^{1}\left(\bar{\Omega}_{\beta}\right)} \tag{array}
\end{align*}
$$

Combining (318), (3 19) and (3 20), we obtain for any $m>1 / d_{k}$, any $\mathscr{H}$ and $k$

$$
\begin{align*}
\lim _{h \rightarrow 0} \sup \left(-\int_{\Omega_{h}} \nabla y_{h} \cdot \nabla \varphi_{h} d x\right)= & \lim _{h \rightarrow 0} \sup \left\{-\int_{G_{m}} \nabla y_{h} \cdot \nabla \omega_{h} d x-\right. \\
-\int_{\Omega_{r}-\Omega} \nabla y_{h} \cdot \nabla \omega_{h} d x & \left.-\int_{\left(\Omega-G_{m}\right) \cap \Omega_{h}} \nabla y_{h} \cdot \nabla \omega_{h} d x\right\} \geqq \\
& \geqq-\int_{G_{m}} \nabla y^{0} \cdot \nabla \oplus_{k}^{\mathscr{H}} d x-C_{\mathscr{H}} / \sqrt{m} \tag{array}
\end{align*}
$$

where $C_{\mathscr{H}}$ depends on $\mathscr{H}$ but not on $m$

In a simılar way we get

$$
\begin{gather*}
\lim _{h \rightarrow 0} \sup \int_{\Omega_{h}}-f v_{h} d x \geqq-\int_{G_{m}} f y^{0} d x-C_{0}\|f\|_{0 \Omega-G_{m}},  \tag{array}\\
\lim _{h \rightarrow 0} \int_{\Omega_{h}} f \oplus_{h} d x=\lim _{h \rightarrow 0} \int_{\Omega_{\cap} \Omega_{h}} f \oplus_{h} d x=\int_{\Omega} f \oplus_{k}^{\mathscr{H}} d x, \tag{array}
\end{gather*}
$$

where the estımate (312) has also been used
From (3 17) it follows

$$
\begin{aligned}
&-\int_{G_{m}}\left|\nabla y_{h}\right|^{2} d x \geqq-\int_{\Omega_{h}} \nabla y_{h} \cdot \nabla \oplus_{h} d x+\int_{\Omega_{h}} f\left(\wp_{h}-y_{h}\right) d x+ \\
&+\left[L_{h}\left(v_{h}, \hat{\oplus}_{h}-\hat{y}_{h}\right)-\int_{\Omega} v_{h} \hat{f}\left(\hat{\oplus}_{h}-\hat{y}_{h}\right) d x\right] \\
&+\left[a\left(v_{h}, \hat{y}_{h}, \hat{\varrho}_{h}-\hat{y}_{h}\right)-a_{h}\left(v_{h}, \hat{\varrho}_{h}-\hat{y}_{h}\right)\right]
\end{aligned}
$$

For $h \rightarrow 0$ we obtain, on the basis of $\left(\begin{array}{ll}3 & 13\end{array}\right),\left(\begin{array}{ll}3 & 14\end{array}\right),(39),(321),(322)$ and (3 23)

$$
\begin{aligned}
-\int_{G_{m}}\left|\nabla y^{0}\right|^{2} d x \geqq & \lim \sup \left[-\int_{G_{m}}\left|\nabla y_{h}\right|^{2} d x\right] \geqq \\
\geqq & \geqq-\int_{G_{m}} \nabla y^{0} \cdot \nabla \bigoplus_{k}^{\mathscr{\varphi}} d x-C_{\mathscr{H}} / \sqrt{m} \\
& \quad+\int_{\Omega} f \emptyset_{k}^{\mathscr{H}} d x-\int_{G_{m}} f y^{0} d x-C_{0}\|f\|_{0 \Omega-G_{m}}
\end{aligned}
$$

Applying (313) and (3 14), we have used the estımate

$$
\left|\hat{\omega}_{h}-\hat{y}_{h}\right|_{1 \Omega} \leqq C_{k \mathscr{H}}<\infty \quad \forall h,
$$

which in turn is an easy consequence of (3 6), (37) (for $\left.\oplus_{h}\right)$ and (312)
Passing to the limit with $m \rightarrow \infty$, we obtain

$$
\int_{\Omega} \nabla y^{0} \cdot \nabla\left(\oplus_{k}^{\mathscr{H}}-y^{0}\right) d x \geqq \int_{\Omega} f\left(\varphi_{k}^{\mathscr{H}}-y^{0}\right) d x
$$

Finally, we let $\mathscr{H} \rightarrow 0$ and $k \rightarrow \infty$ to get from (3 11)

$$
\int_{\Omega} \nabla y^{0} \cdot \nabla\left(z-y^{0}\right) d x \geqq \int_{\Omega} f\left(z-y^{0}\right) d x \quad \text { QED }
$$

Lemma 3.2 : Let the assumptions of Lemma 3.1 hold. Then a subsequence of $\left\{v_{h}\right\}$ exists such that

$$
\lim _{h \rightarrow 0} \mathcal{F}_{t h}\left(v_{h}\right)=\mathcal{F}_{\imath}(v), \quad i=1,2,3
$$

Proof : Let $i=1$. Using the functions $g_{h} \hat{y}_{h}$ and piecewise constant functions $p_{h} v_{h}$, which equal to $v_{h}\left(\xi_{J}\right)$ in every subinterval $e_{J}$, wé may write

$$
J_{1 h}\left(v_{h} ; \hat{y}_{h}\right)=\int_{\hat{\Omega}} p_{h} v_{h}\left(g_{h} \hat{y}_{h}-z_{0}\right)^{2} d \hat{x}
$$

From the estimate (see [1], (7.34))

$$
\left\|g_{h} \hat{y}_{h}-\hat{y}_{h}\right\|_{0, \hat{\Omega}} \leqq h \sqrt{2}\left|\hat{y}_{h}\right|_{1, \hat{\Omega}}
$$

and (3.6) we derive easily that

$$
\begin{equation*}
\lim _{h \rightarrow 0} J_{1 h}\left(v_{h} ; \hat{y}_{h}\right)=\lim _{h \rightarrow 0} \int_{\hat{\Omega}}\left|\hat{y}_{h}-z_{0}\right|^{2} v_{h} d \hat{x} \tag{3.24}
\end{equation*}
$$

On the other hand, recall that

$$
\begin{align*}
\int_{\hat{\Omega}}\left|\hat{y}_{h}-z_{0}\right|^{2} v_{h} d \hat{x}= & \int_{\Omega_{h}}\left(y_{h}-z_{0}\right)^{2} d x= \\
& =\int_{G_{m}}\left(y_{h}-z_{0}\right)^{2} d x+\int_{\Omega_{h}-G_{m}}\left(y_{h}-z_{0}\right)^{2} d x . \tag{3.25}
\end{align*}
$$

From the Rellich's theorem and Lemma 3.1 we get

$$
\begin{equation*}
\lim _{h \rightarrow 0} \int_{G_{m}}\left(y_{h}-z_{0}\right)^{2} d x=\int_{G_{m}}\left(y(v)-z_{0}\right)^{2} d x \tag{3.26}
\end{equation*}
$$

Second, we prove that

$$
\begin{equation*}
\lim _{\substack{h \rightarrow 0 \\ m \rightarrow \infty}} \int_{\Omega_{h}-G_{m}}\left(y_{h}-z_{0}\right)^{2} d x=0 \tag{3.27}
\end{equation*}
$$

Recall that the curve $F_{h}^{-1}\left(\gamma_{m}\right)$ is the graph of the function

$$
\psi_{h m}\left(\hat{x}_{2}\right)=\frac{v\left(\hat{x}_{2}\right)-\frac{1}{m}}{v_{h}\left(\hat{x}_{2}\right)}
$$

and

$$
\begin{equation*}
\lim _{\substack{h \rightarrow 0 \\ m \rightarrow \infty}}\left|\psi_{h m}-1\right| \rightarrow 0 \quad \text { uniformly } \tag{3.28}
\end{equation*}
$$

Then

$$
\begin{aligned}
& \int_{\Omega_{h}-G_{m}}\left(y_{h}-z_{0}\right)^{2} d x=\int_{0}^{1} v_{h} d \hat{x}_{2} \int_{\psi_{h m}\left(x_{2}\right)}^{1}\left(\hat{y}_{h}-z_{0}\right)^{2} d \hat{x}_{1} \leqq \\
& \leqq \beta \int_{\hat{V}_{h m}}\left(\hat{y}_{h}-z_{0}\right)^{2} d \hat{x}=C \beta\left(\text { mes } \hat{V}_{h m}\right)^{1 / 2}\left[\int_{\hat{\Omega}}\left(\hat{y}_{h}-z_{0}\right)^{4} d \hat{x}\right]^{1 / 2}
\end{aligned}
$$

where $\hat{V}_{h m} \equiv F_{h}^{-1}\left(\Omega_{h}-G_{m}\right)$. Since

$$
\left\|\hat{y}_{h}-z_{0}\right\|_{L^{4}(\hat{\Omega})} \leqq C\left\|\hat{y}_{h}-z_{0}\right\|_{1, \hat{\Omega}} \leqq C_{3}<\infty \quad \forall h
$$

and mes $\hat{V}_{h m}$ tends to zero by virtue of (3.28), (3.27) is true. From (3.24), (3.25), (3.26) and (3.27), the assertion of the Lemma follows.

Let $i=2$. According to (2.4) and (3.4), (3.13) we may write
$\lim _{h \rightarrow 0} \mathscr{g}_{2 h}\left(v_{h}\right)=\lim a_{h}\left(v_{h}, \hat{y}_{h}, \hat{y}_{h}\right)=\lim L_{h}\left(v_{h}, \hat{y}_{h}\right)=$

$$
=\lim \int_{\hat{\Omega}} v_{h} \hat{f} \hat{y}_{h} d \hat{x}=\lim \int_{\Omega_{h}} f y_{h} d x
$$

Since

$$
\int_{\Omega_{h}} f y_{h} d x=\int_{\mathbf{G}_{m}} f y_{h} d x+\int_{\Omega_{h}-G_{m}} y_{h} d x
$$

and from (3.8) it follows that

$$
\lim _{\substack{h \rightarrow 0 \\ m \rightarrow \infty}}\left|\int_{\Omega_{h}-G_{m}} f y_{h} d x\right| \leqq C \lim _{\substack{m \rightarrow \infty \\ h \rightarrow 0}}\|f\|_{0, \Omega_{h}-G_{m}}=0
$$

we obtain

$$
\lim _{h \rightarrow 0} \int_{\Omega_{h}} f y_{h} d x=\int_{\Omega(v)} f y(v) d x=\int_{\Omega(v)}|\nabla y|^{2} d x=\mathcal{F}_{2}(v)
$$

Let $i=3$. Recall that we have (see (2.4'))

$$
y_{3 h}\left(v_{h}\right)=J_{3}\left(y_{h}\right)=\left.\int_{0}^{1} y_{h}\right|_{\Gamma_{h}} d x_{2}
$$

Following the argument of Lemma 1.3 with $y_{h}$ instead of $y_{n}$ and using (3.8), (3.9), we obtain the assertion of the Lemma 3.2. Q.E.D.

Theorem 3.1 : Assume that $f \in C^{1}\left(\bar{\Omega}_{\beta}\right)$. Let $\left\{u_{h}\right\}, h \rightarrow 0$, be a sequence of solutions of the approximate problems $\left(P_{t h}\right), \imath=1,2,3$ and let $\hat{Y}=\hat{Y}_{h}\left(u_{h}\right)$ be the concoponding solutions of (2 3) (with $\left.w_{h} \equiv u_{h}\right), Y_{h}=\hat{Y}_{h} \circ F_{h}^{-1}$.

Then a subsequence of $\left\{u_{h}\right\}$ exists such that for $h \rightarrow 0$

$$
\begin{gather*}
u_{h} \rightarrow u \text { in } C([0,1]),  \tag{3.29}\\
Y_{h} \rightarrow y(u)(\text { weakly }) \text { in } H^{1}\left(G_{m}\right) \quad \forall m>\alpha^{-1}, \tag{3.30}
\end{gather*}
$$

where $u$ and $y(u)$ is a solution of the problem $\left(P_{\imath}\right)$ and of $(1.6)$ with $w \equiv u$, respectively, $G_{m}$ ss the domain bounded by the graph of $u-1 / m$.

Any subsequence of $\left\{u_{h}\right\}$, converging in $C([0,1])$, has the property (3.30).
Proof: Consider a function $v \in \mathscr{U}_{a d}$. There exists a sequence $\left\{v_{h}\right\}, h \rightarrow 0$ such that $v_{h} \in \mathscr{U}_{a d}^{h}, v_{h} \rightarrow v$ in $C([0,1])$ (see e.g. [1], Lemma 7.1). Let $\hat{y}_{h}$ be the solutions of (2.3) for $w_{h} \equiv v_{h}$ and $y_{h}=\hat{y}_{h} \circ F_{h}^{-1}$.

Since $\mathscr{U}_{a d}$ is compact in $C([0,1])$, a subsequence of $\left\{u_{h}\right\}$ exists such that $u_{h} \rightarrow u$ in $C([0,1])$ and $u \in \mathscr{U}_{a d}$.

The definition of the problem $\left(P_{t h}\right)$ yields

$$
\mathcal{F}_{t h}\left(u_{h}\right) \leqslant \mathcal{F}_{t h}\left(v_{h}\right) \quad \forall h, \quad \imath=1,2,3
$$

Let us apply Lemmas 3.1 and 3.2 to both sequences $\left\{u_{h}\right\}$ and $\left\{v_{h}\right\}$, to obtain

$$
\mathscr{F}_{1}(u) \leqq \mathcal{F}_{1}(v)
$$

Consequently, $u$ is a solution of $\left(P_{t}\right)$. The convergence (3.30) follows from Lemma 3.1.
