# WEIL-CHÂTELET GROUPS OVER LOCAL FIELDS : ADDENDUM

### By JAMES S. MILNE

By using the structure theorems for the Néron minimal model of an abelian variety with semi-stable reduction, as presented in [2], it is possible to complete the proof of the following theorem. (Notations are as in [3].)

THEOREM. — Let A be an abelian variety over a local field K (with finite residue field) and let  $\hat{A}$  be the dual abelian variety. Then the pairings

$$\mathrm{H}^r$$
 (K, A)  $imes$   $\mathrm{H}^{1-r}$  (K,  $\mathbf{\hat{A}}$ )  $ightarrow$   $\mathrm{H}^2$  (K,  $\mathbf{G}_m$ )  $pprox$  **Q**/**Z**,

as defined by Tate [4], are non-degenerate for all r.

After [3], we need only consider the case where K has characteristic  $p \neq 0$ . Also we have only to prove that the map

$$\theta_{\mathbf{K}}(\mathbf{A})_{p}: \mathbf{H}^{1}(\mathbf{K}, \mathbf{A})_{p} \rightarrow \left(\mathbf{\hat{A}}(\mathbf{K})^{(p)}\right)^{*}$$

is injective, and it suffices to do this after making a finite separable field extension. Thus we may assume that  $\Lambda$  and  $\hat{\Lambda}$  have semi-stable reduction ([2], § 3.6) and that

$$A_{\rho}(K) = A_{\rho}(\overline{K}), \qquad \hat{A}_{\rho}(K) = \hat{A}_{\rho}(\overline{K}).$$

J. S. MILNE

Let  $\mathfrak{A}$  be the Néron minimal model of A over R. The Raynaud group  $\mathfrak{A}^{\ddagger}$  of  $\mathfrak{A}$  over R is a smooth group scheme over R such that : (a) there are canonical isomorphisms  $\overline{\mathfrak{A}} \stackrel{\boldsymbol{z}}{\to} \overline{\mathfrak{A}}^{\ddagger}$  and  $\overline{\mathfrak{A}}^{\circ} \stackrel{\boldsymbol{z}}{\to} \overline{\mathfrak{A}}^{\ddagger_{0}}$  (where  $\overline{\mathscr{H}}$  denotes the formal completion of a scheme  $\mathscr{H}$  over R) and (b) there is an exact sequence  $0 \to \mathfrak{G} \to \mathfrak{A}^{\ddagger_{0}} \to \mathfrak{B} \to 0$  in which  $\mathscr{B}$  is an abelian scheme and  $\mathfrak{G}$  is a torus ([2], § 7.2).  $\mathscr{H} = (\mathfrak{A}^{\ddagger_{0}})_{p}$  is identified through the isomorphism in (a) with the maximal finite flat subgroup scheme of the quasi-finite group scheme  $\mathfrak{A}_{p}^{\circ}$ . If we write  $B = \mathfrak{B} \otimes_{R} K$ ,  $N = \mathscr{H} \otimes_{R} K$ , ..., then we get a filtration  $A_{p} = \mathfrak{A}_{p}^{\circ} \otimes_{R} K \supset N \supset T_{p} \supset 0$  of  $A_{p}$  in which  $N/T_{p} \approx B_{p}$ .

Let  $\mathfrak{A}', \mathfrak{B}', \mathfrak{N}', \ldots$  be the schemes corresponding, as above, to  $\hat{\mathbf{A}}$ . The canonical non-degenerate pairing  $A_p \times \hat{A}_p \to \mathbf{G}_m$  respects the filtrations on  $A_p$  and  $\hat{A}_p$ , i. e. N and  $\mathbf{T}_p$  are the exact annihilators of  $\mathbf{T}'_p$  and N' respectively. Indeed, the induced pairing  $\mathbf{N} \times \mathbf{N}' \to \mathbf{G}_m$  has a canonical extension to a pairing  $\mathfrak{N} \times \mathfrak{N}' \to \mathbf{G}_{m,\mathbf{R}}$  ([2], § 1.4). This pairing is trivial on  $\mathfrak{G}_p$  and  $\mathfrak{G}'_p$  and the quotient pairing  $\mathfrak{B}_p \times \mathfrak{B}'_p \to \mathbf{G}_{m,\mathbf{R}}$  is the non-degenerate pairing defined by a Poincaré divisorial correspondence on  $(\mathfrak{G}, \mathfrak{G}')$  ([2], § 7.4, 7.5). This shows that  $\mathbf{T}_p$  (resp.  $\mathbf{T}'_p$ ) is the left (resp. right) kernel in the pairing  $\mathbf{N} \times \mathbf{N}' \to \mathbf{G}_m$ . The pairing  $A_p/\mathbf{T}_p \times \mathbf{N}' \to \mathbf{G}_m$  is right non-degenerate. But  $A_p/\mathbf{T}_p$  has rank  $p^{2n-\psi}$  where  $n = \dim$  (A) and  $\mu = \dim$  ( $\mathfrak{F}$ ) and N' has rank  $p^{\mu+2\alpha}$ , where  $\alpha = \dim$  ( $\mathfrak{G}$ ) (cf. [2], § 2.2.7). This shows that the pairing is also left non-degenerate (because  $n = \mu + \alpha$ ), which completes the proof of our assertion.

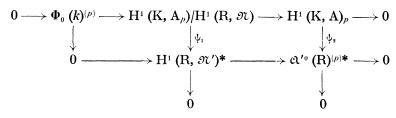

Consider the commutative diagram :

$$\begin{array}{c} \mathfrak{A}^{0} (\mathbf{R})^{(p)} \longrightarrow \mathrm{H}^{1} (\mathbf{R}, \mathfrak{A}_{p}^{0}) \\ \downarrow \qquad \qquad \downarrow \\ \mathbf{A} (\mathbf{K})^{(p)} \longrightarrow \mathrm{H}^{1} (\mathbf{K}, \mathbf{A}_{p}) \end{array}$$

in which the horizontal maps are bondary maps in the cohomology sequences for multiplication by p on A and  $\mathfrak{A}^{\mathfrak{o}}$ . H<sup>4</sup> (R,  $\mathfrak{A}_{p}^{\mathfrak{o}}$ )  $\approx$  H<sup>4</sup> (R,  $\mathfrak{R}$ ) because  $\mathfrak{A}_{p}^{\mathfrak{o}}/\mathfrak{R}$  is smooth over R with zero special fibre and so has zero cohomology groups ([1], § 11.7) (including in dimension 0). The top arrow is an isomorphism because H<sup>4</sup> (R,  $\mathfrak{A}^{\mathfrak{o}}$ ) = 0 (loc. cit). The cokernel of the left vertical arrow is  $\Phi_{\mathfrak{o}}(k)^{(p)}$ , where  $\Phi_{\mathfrak{o}}$  is the group of connected components of  $\mathfrak{A} \otimes_{\mathbb{R}} k$  (cf. [2], § 11.1). Using all of this, one can extract from the top diagram on p. 275 of [3] (with m = p) an exact commutative

262

diagram :

It is easy to see that  $\theta_{\kappa}$  (A)<sub>p</sub> is an isomorphism if and only if

$$[\ker \psi_2] = [\hat{\mathbf{A}} (\mathbf{K})^{(p)} / \mathfrak{A}'^0 (\mathbf{R})^{(p)}], \quad \text{ i. e. } [\ker \psi_2] = [\Phi'_0 (k)^{(p)}].$$

We shall show that

$$[\ker \psi_1] = p^{2\mu}, \qquad [\Phi_0(k)^{(p)}] = p^{\mu} = [\Phi'_0(k)^{(p)}],$$

and as  $[\ker \psi_2] [\Phi_0 (k)^{(p)}] = [\ker \psi_1]$ , this completes the proof.

Consider first the situation : M is a finite group scheme over K and  $\mathfrak{N}$ and  $\mathfrak{N}'$  are finite flat group schemes over R with given embeddings  $N \to M, N' \to \hat{M}$ . If  $\mathfrak{N} = \mathfrak{B}_p$  for some abelian scheme  $\mathfrak{B}$  over R and  $M = N, \ \mathfrak{N}' = \hat{\mathfrak{N}}$ , then

$$\psi: H^{\scriptscriptstyle 1}$$
 (K, M)/ $H^{\scriptscriptstyle 1}$  (R,  $\mathfrak{N}$ )  $\rightarrow H^{\scriptscriptstyle 1}$  (R,  $\mathfrak{N}'$ )\*,

the map defined by the cup-product pairing

$$\mathrm{H}^{_{1}}(\mathrm{K},\,\mathrm{M})\! imes\!\mathrm{H}^{_{1}}(\mathrm{K},\,\mathbf{\hat{M}})
ightarrow\mathrm{H}^{_{2}}(\mathrm{K},\,\mathbf{G}_{m}),$$

is an isomorphism [3]. If  $\mathfrak{N} = \boldsymbol{\mu}_p$ , M = N, and  $\mathfrak{N}' = 0$ , then  $[\ker \psi] = p$  because [3]

$$\mathrm{H}^{_{1}}(\mathrm{K}, \boldsymbol{\mu}_{p})/\mathrm{H}^{_{1}}(\mathrm{R}, \boldsymbol{\mu}_{p}) \approx \mathrm{H}^{_{1}}(\mathrm{R}, \mathbf{Z}/p \ \mathbf{Z})^{*} \approx \mathrm{H}^{_{1}}(k, \mathbf{Z}/p \ \mathbf{Z})^{*}.$$

If  $M = \mathbf{Z}/p \mathbf{Z}$ ,  $\mathfrak{N} = 0$ , and  $\mathfrak{N}' = \boldsymbol{\mu}_p$ , then  $[\ker \psi] = p$  because [3]  $\ker \psi = H^1(\mathbf{R}, \mathbf{Z}/p \mathbf{Z})$ . It follows from this, and the above discussion of the structures of  $A_p$  and  $\hat{A}_p$ , that  $[\ker \psi_1] = p^{2\mu}$ .

Finally, let  $\Phi = \alpha^{\sharp}/\alpha^{\sharp^0}$ . It is a finite étale group scheme over R such that  $\Phi \otimes_{\mathbb{R}} k = \Phi_0$ , and there is an exact sequence

$$0 o \mathfrak{N} o \mathfrak{A}_p^{\sharp} o \Phi_p o 0.$$

 $\mathfrak{A}_{p}^{\sharp}(\mathbf{R}) \approx \mathfrak{A}_{p}(\mathbf{R}), \text{ because } \mathfrak{A}_{p}^{\sharp} \text{ and } \mathfrak{A}_{p} \text{ differ only by a scheme with empty special fibre, and } \mathfrak{A}_{p}(\mathbf{R}) \approx \mathfrak{A}_{p}(\mathbf{K}).$  It follows that  $\Phi_{p}(\mathbf{K}) = A_{p}(\mathbf{K})/N(\mathbf{K})$  has  $p^{\mu}$  elements. But

$$\Phi (\mathrm{K}) \approx \Phi (\mathrm{R}) \approx \Phi_0 (k) \quad \text{and so} \quad [\Phi_0 (k)^{(p)}] = [\Phi_0 (k)_p] = p^{\mu}.$$
