# The Fermion Number Processes as a Functional Central Limit of Quantum Hamiltonian Models 

by<br>L. ACCARDI and Y. G. LU<br>Centro Matematico V. Volterra, Dipartimento di Matematica, Universitá di Roma II

#### Abstract

In the present paper, we investigate, in the Fermion case, how the number processes arise from a limit of a quantum Hamiltonian model. Our conclusion is that the time evolution of a certain quantum Hamiltonian model tends to the solution of a quantum stochastic differential equation driven by the Fermion number processes.

Résumé. - Dans cet article nous étudions comment le processus de nombre de fermions apparaît comme une limite dans un modèle Hamiltonien quantique. Notre conclusion est que l'évolution temporelle d'un certain modèle Hamiltonien converge vers la solution d'une équation différentielle stochastique avec une source qui est le processus du nombre de fermions.

## 1. INTRODUCTION

In the series papers ([1], ..., [6]), we have investigated in the Boson case the low density limit of a quantum Hamiltonian system and shown

[^0]that the time evolution of the quantum Hamiltonian system tends to a quantum stochastic process which satisfies a quantum stochastic differential equation diven by quantum Poisson processes.

The present paper is devoted to the Fermion analogue of [1] and for sake of brevity we shall omit here the motivations of the problem and refer the reader to the "Introduction" of [1], [6].

Following the pattern of [3], we formulate the problem for a general quasi-free state and we prove the convergence of the kinematical process of the collective number vectors to Fermion Brownian motion in the general case. Starting from Section 3 we restrict our attention to the Fock case.

Let $\mathrm{H}_{0}$ denote the system Hilbert space; $\mathrm{H}_{1}$ the one particle reservoir Hilbert space and $\mathrm{W}\left(\mathrm{H}_{1}\right)$ the CAR-algebra on $\mathrm{H}_{1}$, i.e. the algebra generated by the set

$$
\begin{equation*}
\left\{\mathbf{A}(f): f \in \mathbf{H}_{1}\right\} \tag{1.1}
\end{equation*}
$$

where, $\mathrm{A}(f)$ is the Fermion annihilation operator. Let H be a selfadjoint bounded below operator on $\mathrm{H}_{1}$ and $z, \beta$ positive real numbers interpreted respectively as density of the reservoir particles and inverse temperature. Denote $\varphi$ the Fock state characterized by the condition:

$$
\begin{equation*}
\varphi\left(\mathrm{A}^{+}(f) \mathrm{A}(g)\right)=\langle f, g\rangle, \quad \forall f \in \mathrm{H}_{1} \tag{1.2}
\end{equation*}
$$

and let $\{\mathscr{H}, \pi, \Phi\}$ be the GNS-triple of $\left\{\mathrm{W}\left(\mathrm{H}_{1}\right), \varphi\right\}$, so that

$$
\begin{equation*}
\left\langle\Phi, \pi\left(\mathrm{A}^{+}(f)\right) \pi(\mathrm{A}(g)) \Phi\right\rangle=\varphi\left(\mathrm{A}^{+}(f) \mathrm{A}(g)\right) \tag{1.3}
\end{equation*}
$$

We whall write $A\left(\operatorname{resp} . \mathrm{A}^{+}\right)$for $\pi^{\circ} \mathrm{A}$ (resp. $\pi^{\circ} \mathrm{A}^{+}$). Let $\mathrm{S}_{t}$ be a unitary group on $B\left(H_{1}\right)$ (the one particle free evolution of the reservoir). The second quantization of $S_{t}$, denoted $\Gamma\left(\mathrm{S}_{t}\right)$, leaves $\varphi$ invariant hence it is implemented, in the GNS representation, by a 1-parameter unitary group $\mathrm{V}_{t}$ whose generator $\mathrm{H}_{\mathrm{R}}$ is called the free Hamiltonian of the reservoir. As in [3] we assume that there exists a non zero subspace K of $\mathrm{H}_{1}$ (in all the examples it is a dense subspace) such that

$$
\begin{equation*}
\int_{\mathrm{R}}\left|\left\langle f, \mathrm{~S}_{t} g\right\rangle\right| d t<\infty, \quad \forall f, g \in \mathrm{~K} \tag{1.4}
\end{equation*}
$$

Let be given a self-adjoint operator $H_{S}$ on the system space $H_{0}$, called the system Hamiltonian. The total free Hamiltonian is defined to be

$$
\begin{equation*}
\mathbf{H}^{(0)}:=\mathbf{H}_{\mathbf{S}} \otimes 1+1 \otimes \mathrm{H}_{\mathrm{R}} \tag{1.5}
\end{equation*}
$$

We define the interaction Hamiltonian V as in [1] i. e., we fix two functions $g_{1}, g_{0} \in \mathrm{~K}$ and define

$$
\begin{align*}
\mathrm{V}:=i\left(\mathrm{D} \otimes \mathrm{~A}^{+}\left(g_{0}\right) \cdot \mathrm{A}\left(g_{1}\right)-\mathrm{D}^{+} \otimes\right. & \left.\mathrm{A}^{+}\left(g_{1}\right) \cdot \mathrm{A}\left(g_{0}\right)\right) \\
& =i \sum_{\varepsilon \in\{0,1\}} \mathrm{D}_{\varepsilon} \otimes \mathrm{A}^{+}\left(g_{\varepsilon}\right) \cdot \mathrm{A}\left(g_{1-\varepsilon}\right) \tag{1.6}
\end{align*}
$$

with the notations

$$
\begin{equation*}
\mathrm{D}_{0}=\mathrm{D}, \quad \mathrm{D}_{1}=-\mathrm{D}^{+} \tag{1.7}
\end{equation*}
$$

and where D is a bounded operator on $\mathrm{H}_{0}$ satisfying

$$
\begin{equation*}
\exp \left(-i t \mathrm{H}_{\mathrm{S}}\right) \cdot \mathrm{D} \cdot \exp \left(i t \mathrm{H}_{\mathrm{S}}\right)=\mathrm{D} \tag{1.8}
\end{equation*}
$$

Moreover we assume that $g_{0}$ and $g_{1}$ have disjoint energy spectra, i.e.

$$
\begin{equation*}
\left\langle g_{0}, \mathrm{~S}_{t} g_{1}\right\rangle=0, \quad \forall t \in \mathbf{R} \tag{1.9}
\end{equation*}
$$

More general interactions will be discussed in subsequent papers.
The condition (1.9) is natural and has already been used in the literature on the weak coupling limit (cf. [8], [8a], [8b]). With the condition (1.9), the condition (1.8) is also natural since a typical example for $D$ in quantum optics is $D=|0\rangle\langle 1|$, where $|1\rangle,|0\rangle$ are eigenvectors of the system Hamiltonian $\mathrm{H}_{0}$ (rotating wave approximation). This corresponds to $\left[H_{0}, \mathrm{D}\right]=\left(\omega_{1}-\omega_{0}\right) \mathrm{D}\left(\omega_{1}, \omega_{0}\right.$ are the eigenvalues). The condition (1.8) corresponds to taking $\omega_{1}=\omega_{0}$, but the choice $\omega_{1} \neq \omega_{0}$ results only in a trivial shift in the one particle reservoir Hamiltonian (cf. Section 5 in [6] for the detail). Also from the point of view of mathematics, the difference between the condition (1.8) and the general N -level case is as we have shown in [3], only to applying (many times) Reimann-Lebesgue Lemma - of course a different quantum process is obtained in the N -levels case but the difference is not fundamental (cf. [3], for the weak coupling case [9]).

With these notations, the total Hamiltonian is

$$
\begin{equation*}
\mathrm{H}_{\text {total }}:=\mathrm{H}_{\mathrm{S}} \otimes 1+1 \otimes \mathrm{H}_{\mathrm{R}}+\mathrm{V} \tag{1.10}
\end{equation*}
$$

and the wave operator at time $t$ is defined by

$$
\begin{equation*}
\mathrm{U}_{t}:=\exp \left(-i t \mathrm{H}^{(0)}\right) \cdot \exp \left(i t \mathrm{H}_{\text {total }}\right) \tag{1.11}
\end{equation*}
$$

Therefore we have the equation

$$
\begin{equation*}
\frac{d}{d t} \mathrm{U}_{t}=\frac{1}{i} \mathrm{~V}(t) \mathrm{U}_{t} ; \quad \mathrm{U}(0)=1 \tag{1.12}
\end{equation*}
$$

where,

$$
\begin{align*}
\mathrm{V}(t):=\exp \left(-i t \mathrm{H}_{\mathrm{S}} \otimes 1\right) \mathrm{V} \exp & \left(i t \mathrm{H}_{\mathrm{S}} \otimes 1\right) \\
= & i \sum_{\varepsilon \in\{0,1\}} \mathrm{D}_{\varepsilon} \otimes \mathrm{A}^{+}\left(\mathrm{S}_{t} g_{\varepsilon}\right) \mathrm{A}\left(\mathrm{~S}_{t} g_{1-\varepsilon}\right) \tag{1.13}
\end{align*}
$$

Moreover the solution of (1.12) is given by the iterated series

$$
\begin{equation*}
\mathrm{U}_{t}=\sum_{n=0}^{\infty} \int_{0}^{t} d t_{1} \ldots \int_{0}^{t_{n-1}} d t_{n}(-i)^{n} \mathrm{~V}\left(t_{1}\right) \ldots \mathrm{V}\left(t_{n}\right) \tag{1.14}
\end{equation*}
$$

which is norm convergent since the field operators are bounded.

An important role in the present paper will be played by the collective number vectors defined by

$$
\begin{equation*}
u \otimes \Phi_{\mathrm{N}}\left(z \int_{\mathrm{S}_{k} / z^{2}}^{\mathrm{T}_{k} / z^{2}} \mathrm{~S}_{u} f_{k} d u, k=1, \ldots, \mathrm{~N}\right) \tag{1.15}
\end{equation*}
$$

where $u \in \mathrm{H}_{0}$, and for each $n \in \mathrm{~N}, f_{1}, \ldots, f_{n} \in \mathrm{H}_{1}$

$$
\begin{equation*}
\Phi_{n}\left(f_{k}, k \in\{1, \ldots, n\}\right):=\mathrm{A}^{+}\left(f_{1}\right) \ldots \mathrm{A}^{+}\left(f_{n}\right) \Phi \tag{1.16}
\end{equation*}
$$

From Lemma (3.2) of [10], we know that the assumption (1.4) implies that the sesquilinear form (.|.): $\mathrm{K} \times \mathrm{K} \rightarrow \mathscr{C}$ defined by

$$
\begin{equation*}
(f \mid g):=\int_{\mathbf{R}}\left\langle f, \mathrm{~S}_{t} g\right\rangle d t, \quad f, g \in \mathrm{~K} \tag{1.17}
\end{equation*}
$$

defines a pre-scalar product on $K$. We denote $\{K,(. \mid)$.$\} , or simply K$, the completion of the quotient of K by the zero (.|.)-norm elements.

The analogy with the new techniques, developed in [13], for the weak coupling limit, suggests to consider the limit, as $z \rightarrow 0$ of expressions of the form

$$
\begin{align*}
& \langle u,(.) v\rangle \otimes \varphi_{\mathrm{Q}_{z}}\left(1 \otimes \Phi_{\mathrm{N}}\left(z \int_{\mathrm{S}_{k} / z^{2}}^{\mathrm{T}_{k} / z^{2}} \mathrm{~S}_{u} f_{k} d u, k=1, \ldots, \mathrm{~N}\right)\right. \\
& \left.v \otimes \mathrm{U}_{t / z^{2}}(\mathrm{X} \otimes 1) \mathrm{U}_{t / z^{2}}^{+} \mathbf{1} \otimes \Phi_{\mathrm{N}^{\prime}}\left(z \int_{\mathrm{S}_{k}^{\prime} / z^{2}}^{\mathrm{T}_{k}^{\prime} / z^{2}} \mathrm{~S}_{u} f_{k}^{\prime} d u, k=1, \ldots, \mathrm{~N}^{\prime}\right)\right) \tag{1.18}
\end{align*}
$$

In analogy with the strategy of [1], the first step in our investigation will be to control the following limit:

$$
\begin{align*}
& \lim _{z \rightarrow 0}\left\langle u \otimes \Phi_{\mathrm{N}}\left(z \int_{\mathrm{S}_{k} / z^{2}}^{\mathrm{T}_{k} / z^{2}} \mathrm{~S}_{u} f_{k} d u, k=1, \ldots, \mathrm{~N}\right)\right. \\
&\left.\mathrm{U}_{\mathrm{t} / \mathrm{z}^{2}} v \otimes \Phi_{\mathrm{N}^{\prime}}\left(z \int_{\mathrm{R}_{k}^{\prime} / z^{2}}^{\mathrm{T}_{k}^{\prime} / z^{2}} \mathrm{~S}_{u} f_{k}^{\prime} d u, k=1, \ldots, \mathrm{~N}^{\prime}\right)\right\rangle \\
&=\lim _{z \rightarrow 0}\left\langle u \otimes \Phi_{\mathrm{N}}\left(z \int_{\mathrm{S}_{k} / z^{2}}^{\mathrm{T}_{k} / z^{2}} \mathrm{~S}_{u} f_{k} d u, k=1, \ldots, \mathrm{~N}\right)\right. \\
& \sum_{n=0}^{\infty} \int_{0}^{t} d t_{1} \ldots \int_{0}^{t_{n-1}} d t_{n}(-i)^{n} \mathrm{~V}\left(t_{1}\right) \ldots \mathrm{V}\left(t_{n}\right) \\
&\left.\Phi_{\mathrm{N}^{\prime}}\left(z \int_{\mathrm{S}_{k}^{\prime} / z^{2}}^{\mathrm{T}_{k}^{\prime} / z^{2}} \mathrm{~S}_{u} f_{k}^{\prime} d u, k=1, \ldots, \mathrm{~N}^{\prime}\right)\right\rangle \tag{1.19}
\end{align*}
$$

We first outline the common and different points between the present work and [1]: Due to the form (1.6) of the interaction, the Wick ordered from of the products

$$
\begin{equation*}
\mathrm{A}^{+}\left(f_{1}\right) \mathrm{A}\left(g_{1}\right) \ldots \mathrm{A}^{+}\left(f_{n}\right) \mathrm{A}\left(g_{n}\right) \tag{1.20}
\end{equation*}
$$

is the main subject to the considered in the low density limit, both in the Boson and the Fermion cases. The only difference between the two cases is some power of $(-1)$ which is due to the different commutation relations. Therefore one can hope that
(1) The negligible terms will be similar to the Boson case.
(2) The uniform estimate theorem in [1] can be used directly to the present situation.
(3) The limit of the non-negligible terms is similar to the Boson case.

Exactly as in the Boson case, the estimates needed to solve this problem will allow, with minor modifications, to control more general situations (cf. [1]). In order to formulate our result, let us recall from [13] the definition of the Fermion Brownian Motion:

Definition (1.1). - Let $\mathscr{K}$ be a Hilbert space, T an interval in R. Let $0 \leqq \mathrm{Q} \leqq 1$ be a self-adjoint operator on $\mathscr{K}$ and let

$$
\begin{equation*}
\left\{\mathscr{H}_{\mathrm{Q}}, \pi_{\mathrm{Q}}, \Phi_{\mathrm{Q}}\right\} \tag{1.21}
\end{equation*}
$$

denote the GNS representation of the CAR algebra over $\mathrm{L}^{2}(\mathrm{~T}, d t ; \mathscr{K})$ with respect to the quasi-free state $\varphi_{\mathrm{Q}}$ on $\mathrm{W}\left(\mathrm{L}^{2}(\mathrm{~T}, d t ; \mathscr{K})\right)$ characterized by

$$
\begin{equation*}
\varphi_{\mathrm{Q}}\left(\mathrm{~A}^{+}(\xi) \mathrm{A}\left(\xi^{\prime}\right)\right)=\left\langle\xi, \frac{1 \otimes(1-\mathrm{Q})}{2} \xi^{\prime}\right\rangle ; \quad \xi, \xi^{\prime} \in \mathrm{L}^{2}(\mathrm{~T}, d t ; \mathscr{K}) \tag{1.22}
\end{equation*}
$$

The quantum stochastic process
$\left\{\Gamma\left(\mathrm{L}^{2}(\mathrm{~T}, d t ; \mathscr{K})\right), \mathrm{A}\left(\chi_{(s, t]} \otimes f\right), \mathrm{A}^{+}\left(\chi_{(s, t]} \otimes f\right) ;(s, t] \subseteq \mathrm{T}, f \in \mathscr{K}\right\}$
where $\mathrm{A}(),. \mathrm{A}^{+}($.$) denote respectively the annihilation and creation fields$ in the representation (1.23), is called the Q-Fermion Brownian Motion on $\mathrm{L}^{2}(\mathrm{~T}, d t ; \mathscr{K})$. The Fock Fermion Brownian Motion corresponds to the choice of $\mathrm{Q}=1$.

Our main result in this paper is to prove that, the limit (1.19) exists and is equal to

$$
\begin{align*}
\left\langleu \otimes \Psi _ { \mathrm { N } } \left(\chi_{\left[\mathrm{S}_{k}, \mathrm{~T}_{k}\right]} \otimes f_{k}, k=\right.\right. & 1, \ldots, \mathrm{~N}), \mathrm{U}(t) \\
& \times v \otimes \Psi_{\mathrm{N}^{\prime}}\left(\chi_{\left[S_{k}^{\prime}, T_{k}^{\prime}\right]} \otimes f_{k}^{\prime}, k=1, \ldots, \mathrm{~N}^{\prime}\right) \tag{1.24}
\end{align*}
$$

where $\left\{\mathscr{H}, \mathrm{A}, \mathrm{A}^{+}, \Psi\right\}$ is the Fock Brownian motion on

$$
\mathrm{L}^{2}(\mathbf{R}, d t ; \mathrm{K}) \cong \mathrm{L}^{2}(\mathrm{R}) \otimes \mathrm{K}
$$

and $\mathrm{U}(t)$ satisfies a quantum stochastic differential equation driven by purely discontinuous noises in the sense of [14] and [15], whose form is given by (5.28).

## 2. THE NOISE SPACE

We know from [1] that for each $\mathrm{S}, \mathrm{T}, \mathrm{S}^{\prime}, \mathrm{T}^{\prime} \in \mathbf{R}$, and $f, f^{\prime} \in \mathrm{K}$ satisfying (1.6), one has

$$
\begin{align*}
\lim _{z \rightarrow 0}\left\langle z \int_{\mathbf{S} / z^{2}}^{\mathbf{T} / z^{2}} \mathbf{S}_{u} f d u, z \int_{\mathbf{S}^{\prime} / z^{2}}^{\mathbf{T}^{\prime} / z^{2}} \mathbf{S}_{u} f^{\prime} d u\right. & \rangle \\
& =\left\langle\chi_{[\mathrm{S}, \mathrm{~T}]}, \chi_{\left[\mathrm{S}^{\prime}, \mathrm{T}^{\prime}\right]}\right\rangle_{\mathbf{L}^{2}}(\mathbf{R}) \cdot\left(f \mid f^{\prime}\right) \tag{2.1}
\end{align*}
$$

Moreover, the limit is uniform for $\mathrm{S}, \mathrm{T}, \mathrm{S}^{\prime}, \mathrm{T}^{\prime}$ in a bounded set in $\mathbf{R}$.
Theorem (2.1). - For each $\quad \mathrm{N}, \quad \mathrm{N}^{\prime} \in \mathbf{N}, \quad f_{1}, \ldots, f_{\mathrm{N}}$, $f_{1}^{\prime}, \ldots, f_{\mathbf{N}^{\prime}}^{\prime} \subset \mathbf{K},\left\{\mathbf{S}_{h}, \mathrm{~T}_{h}\right\}_{h=1}^{\mathrm{N}},\left\{\mathrm{S}_{h}^{\prime}, \mathrm{T}_{h}^{\prime}\right\}_{h=1}^{\mathrm{N}^{\prime}} \subset \mathbf{R}$
$\lim _{z \rightarrow 0}\left\langle\Phi_{\mathrm{N}}\left(z \int_{\mathrm{S}_{k} / z^{2}}^{\mathrm{T}_{k} / z^{2}} \mathrm{~S}_{u} f_{k} d u, k=1, \ldots, \mathrm{~N}\right)\right.$,

$$
\begin{align*}
& \left.\Phi_{\mathrm{N}^{\prime}}\left(z \int_{\mathrm{S}_{k}^{\prime} / z^{2}}^{\mathrm{T}_{k}^{\prime} / z^{2}} \mathrm{~S}_{u} f_{k}^{\prime} d u, k=1, \ldots, \mathrm{~N}^{\prime}\right)\right\rangle \\
& =\left\langle\Psi_{\mathrm{N}}\left(\chi_{\left[\mathrm{S}_{k}, \mathrm{~T}_{k}\right]} \otimes f_{k}, k=1, \ldots, \mathrm{~N}\right),\right. \\
&  \tag{2.2}\\
& \left.\quad \Psi_{\mathrm{N}^{\prime}}\left(\chi_{\left[\mathrm{S}_{k}^{\prime}, \mathrm{T}_{k}^{\prime}\right]} \otimes f_{k}^{\prime}, k=1, \ldots, \mathrm{~N}^{\prime}\right)\right\rangle
\end{align*}
$$

Proof. - The proof is similar to that of Lemma (2.1) of [1]. The only difference being that now we have number rather then coherent collective vectors.

By expanding the scalar product in the left hand side of (2.2) and using the CAR, one finds

$$
\begin{align*}
& \delta_{\mathrm{N}, \mathrm{~N}^{\prime}} \sum_{\sigma, \varepsilon \in \mathscr{S}_{\mathrm{N}}}(-1)^{\|\varepsilon\|+\|\sigma\|} \prod_{k=1}^{\mathrm{N}} z^{2} \int_{\mathrm{S}_{\sigma(k)} / z^{2}}^{\mathrm{T}_{\sigma(k)} / z^{2}} d u \int_{\mathrm{S}_{\varepsilon}^{\prime}(k) / z^{2}}^{\mathrm{T}_{\varepsilon(k)}^{\prime} / z^{2}} \\
& \times d v\left\langle\mathrm{~S}_{u} \mathrm{Q}_{+} f_{\sigma(k)}, \mathrm{S}_{v} \mathrm{Q}_{+} f_{\varepsilon(k)}^{\prime}\right\rangle \tag{2.3}
\end{align*}
$$

which, as $z \rightarrow 0,(2.7)$, by formula (2.1), tends to
$\delta_{\mathrm{N}, \mathrm{N}^{\prime}} \sum_{\sigma, \varepsilon \in \mathscr{S}_{\mathrm{N}}}(-1)^{\|\varepsilon\|+\|\sigma\|}$

$$
\begin{align*}
& \times \prod_{k=1}^{\mathrm{N}}\left\langle\chi_{\left[\mathrm{S}_{\sigma(k)}, \mathrm{T}_{\sigma(k)]},\right.}, \chi_{\left[\mathrm{S}_{\varepsilon(k)}^{\prime}, \mathrm{T}_{\varepsilon}^{\prime}(k)\right]}\right\rangle_{\mathrm{L}^{2}(\mathbf{R})} \cdot\left(f_{\sigma(k)} \mid f_{\varepsilon(k)}^{\prime}\right) \\
& =\left\langle\Psi_{\mathrm{N}}\left(\chi_{\left[\mathrm{S}_{k},\right.}, \mathrm{T}_{k}\right] f_{k}, k=1, \ldots, \mathrm{~N}\right), \\
& \left.\quad \Psi_{\mathrm{N}^{\prime}}\left(\chi_{\left[\mathrm{S}_{k}^{\prime}, r_{k}^{\prime}\right]} \otimes f_{k}^{\prime}, k=1, \ldots, \mathrm{~N}^{\prime}\right)\right\rangle \tag{2.4}
\end{align*}
$$

Since the limit (2.1) corresponds to the 0-th term in the expansion (1.14), Theorem (2.1) shows that our limit processes, if it exists, lives
on the Hilbert space $\Gamma\left(\mathrm{L}^{2}(\mathbf{R}, d t) \otimes \mathrm{K}\right)$ )-the Fermi Fock space over $\mathrm{L}^{2}(\mathbf{R}) \otimes \mathrm{K}$, i.e. the space of the Fermi Fock Brownian Motion.

## 3. THE COLLECTIVE TERMS AND THE NEGLIGIBLE TERMS

Starting from the iterated series (1.14) and using (1.13), one has

$$
\begin{align*}
& (-i)^{n} \mathrm{~V}\left(t_{1}\right) \ldots \mathrm{V}\left(t_{n}\right)=\sum_{\varepsilon \in\{0,1\}^{n}} \mathrm{D}_{\varepsilon(1)} \ldots \mathrm{D}_{\varepsilon(n)} \\
& \quad \otimes \mathrm{A}^{+}\left(\mathrm{S}_{t_{1}} g_{\varepsilon(1)}\right) \mathrm{A}\left(\mathrm{~S}_{t_{1}} g_{1-\varepsilon(1)}\right) \ldots \mathrm{A}^{+}\left(\mathrm{S}_{t_{n}} g_{\varepsilon(n)}\right) \mathrm{A}\left(\mathrm{~S}_{t_{n}} g_{1-\varepsilon(n)}\right) . \tag{3.1}
\end{align*}
$$

In the right hand side of (3.1) the operator on the system space is rather simple and the most important thing is to know what is the contribution of the product of creation and annihilation operators. In order to do this, as usual, we shall bring that product to the normal ordered form. This is done in the following:

Theorem (3.1). - For each $n \in \mathbf{N}$, the normal ordered from of the product

$$
\begin{equation*}
\mathrm{A}^{+}\left(\mathrm{S}_{t_{1}} g_{\varepsilon(1)}\right) \mathrm{A}\left(\mathrm{~S}_{t_{1}} g_{1-\varepsilon(1)}\right) \ldots \mathrm{A}^{+}\left(\mathrm{S}_{t_{n}} g_{\varepsilon(n)}\right) \mathrm{A}\left(\mathrm{~S}_{t_{n}} g_{1-\varepsilon(n)}\right) \tag{3.2}
\end{equation*}
$$

is equal to

$$
\begin{align*}
& \sum_{m=0}^{n-1} \sum_{2 \leqq q_{1}<\ldots<q_{m} \leqq n}(-1)^{\left(n,\left\{q_{h}\right\}_{h=1}^{m}\right)} \prod_{h=1}^{m}\left\langle\mathrm{~S}_{t_{q_{h}-1}} g_{1-\varepsilon\left(q_{h}-1\right)}, \mathrm{S}_{t_{q_{h}}} g_{\varepsilon\left(q_{h}\right)}\right\rangle \\
& \prod_{\alpha \in\{1, \ldots, n\} \backslash\left\{q_{h}\right\}^{m_{h=1}}} \mathrm{~A}^{+}\left(\mathrm{S}_{t_{\alpha}} g_{\varepsilon(\alpha)}\right) . \prod_{\alpha \in\{1, \ldots, n\} \backslash\left\{q_{h}-1\right\}_{h=1}^{m}} \mathrm{~A}\left(\mathrm{~S}_{t_{\alpha}} g_{\varepsilon(\alpha)}\right) \\
& +\sum_{m=0}^{n-1} \sum_{2 \leqq q_{1}<\ldots<q_{m \leqq n}} \sum_{\left(p_{1}, q_{1}, \ldots, p_{m}, q_{m}\right)}^{\prime} \vartheta \prod_{h=1}^{m}\left\langle\mathrm{~S}_{t_{p_{h}}} g_{1-\varepsilon\left(p_{h}\right)}, \mathrm{S}_{t_{q_{h}}} g_{\varepsilon\left(q_{h}\right)}\right\rangle \\
& \prod_{m} \mathrm{~A}^{+}\left(S_{t_{\alpha}} g_{\varepsilon(\alpha)}\right) . \quad \prod_{m} \quad \mathrm{~A}^{+}\left(S_{t_{\alpha}} g_{\varepsilon(\alpha)}\right) \\
& \alpha \in\{1, \ldots, n\} \backslash\left\{q_{h}\right\}_{h=1}^{m} \quad \alpha \in\{1, \ldots, n\} \backslash\left\{p_{h}\right\}_{h=1}^{m} \\
& =: \mathrm{I}_{n}(\varepsilon)+\mathrm{II}_{n}(\varepsilon) \tag{3.3}
\end{align*}
$$

where, $\vartheta^{ \pm} \pm 1$ and ( $n,\left\{q_{h}\right\}_{h=1}^{m}$ ) is defined as

$$
\begin{equation*}
\sum_{\alpha \in\{1, \ldots, n\} \backslash\left\{q_{h}-1\right\}_{h=1}^{m}} \mid\left\{j, j>\alpha, j \in\{1, \ldots, n\} \backslash\left\{q_{h}\right\}_{h=1}^{m} \mid\right. \tag{3.4}
\end{equation*}
$$

The sum $\sum_{\left(p_{1}, q_{1}, \ldots, p_{m}, q_{m}\right)}^{\prime}$ means the sum for all $1 \leqq p_{1}, \ldots, p_{m} \leqq n$ satysfying $\left|\left\{p_{h}\right\}_{h=1}^{m}\right|=m$ (the cardinality of the set $\left\{p_{h}\right\}_{h=1}^{m}$ is equal to $m$ ), $p_{h}<q_{h}$ for any $h=1, \ldots, m$ and $p_{h}<q_{h}-1$ for some $h=1, \ldots, m$.

Remark. - In the second term of (3.3) (type II), the value of 9 is not relevant because we shall majorize the modulus of the sum with the sum
of the moduli (for which the value of $\vartheta$ is irrelevant) and then we prove that the latter tends to zero.

Proof. - The only difference between the proof of this Lemma and that of Lemma (3.1) in [6] is the precise computation of the exponent of $(-1)$ in the type I term, i.e. of the quantity (3.4). This is achieved as follows: by bringing to normal form the products of the creation and annihilation operators in (3.1) and arguing as in Lemma (3.1) of [6], one arrives to an expression which differs from (3.2) only by the replacement of the power of $(-1)$ and by an unknown factor $\vartheta$.

In order to compute this factor, denote
with

$$
\left\{\beta_{h}\right\}_{h=1}^{n-m}=\{1, \ldots, n\} \backslash\left\{q_{h}-1\right\}_{h=1}^{m}
$$

$$
\begin{equation*}
\beta_{1}<\ldots<\beta_{n-m} \tag{3.5}
\end{equation*}
$$

the indices which label the annihilators which have not been used to produce scalar products. Then notice that to move $\mathrm{A}\left(\mathrm{S}_{\mathrm{t}_{\beta_{n-m}}} g_{1-\varepsilon\left(\beta_{n}-m\right)}\right)$ to the right hand side of $\mathrm{A}^{+}\left(\mathrm{S}_{t_{n}} g_{\varepsilon(n)}\right)$ one needs ${ }^{\beta_{n-m}}$ to exchange $\mathrm{A}\left(\mathrm{S}_{\mathrm{t}_{n-m}} g_{1-\varepsilon\left(\beta_{n-m}\right)}\right)$ with the creators which are the right hand side of it and have not not used to produce scalar products, i.e. $\mathrm{A}^{+}\left(\mathrm{S}_{\mathrm{t}_{j}} g_{\varepsilon(j)}\right)$ for $j>\beta_{n-m}$, and $j \in\{1, \ldots, n\} \backslash\left\{q_{h}\right\}_{h=1}^{m}$, so one gets a factor

$$
\begin{equation*}
(-1)^{\mid\left\{j, j>\beta_{n-m}, j \in\{1, \ldots, n\} \backslash\left\{q_{h}\right\}_{h=1}^{m} \mid\right.} \tag{3.6}
\end{equation*}
$$

The same argument shows that to move $\mathrm{A}\left(\mathrm{S}_{\mathrm{t}_{n-m-1}} g_{1-\varepsilon\left(\beta_{n-m-1}\right)}\right)$ to the left hand side of $\mathrm{A}\left(\mathrm{S}_{t_{\beta_{n-m}}} g_{1-\varepsilon\left(\beta_{n-m}\right)}\right)$ one needs to exchange

$$
\mathrm{A}\left(\mathrm{~S}_{t_{\beta_{n-m-1}}} g_{1-\varepsilon\left(\beta_{n-m-1}\right)}\right)
$$

with $\mathrm{A}^{+}\left(\mathrm{S}_{t_{j}} g_{\varepsilon(j)}\right)$ for $j>\beta_{n-m-1}$, and $j \in\{1, \ldots, n\} \backslash\left\{q_{h}\right\}_{h=1}^{m}$. So, one gets a factor

$$
\begin{equation*}
(-1)^{\mid\left\{j, j>\beta_{n-m-1}, j \in\left\{1, \ldots, n \backslash\left\{q_{h}\right\}_{h=1}^{m} \mid\right.\right.} \tag{3.7}
\end{equation*}
$$

Repeating the argument $n-m$ times [i.e. once for each of the $\beta_{j}$ in (3.5)], the factor $(-1)$ to the power (3.4) arises.

Now let investigate the contributions of terms $\mathrm{I}_{n}(\varepsilon)$ and $\mathrm{II}_{n}(\varepsilon)$. First of all we have:

Theorem (3.2). - For each $\mathbf{N}, \quad \mathbf{N}^{\prime} \in \mathbf{N}, \quad n \in \mathbf{N}, \quad f_{1}, \ldots, f_{\mathbf{N}}$, $f_{1}^{\prime}, \ldots, f_{\mathbf{N}^{\prime}}^{\prime} \in \mathrm{K}, \quad\left\{\mathbf{S}_{h}, \mathrm{~T}_{h}\right\}_{h=1}^{\mathrm{N}},\left\{\mathrm{S}_{h}^{\prime}, \mathrm{T}_{h}^{\prime}\right\}_{h=1}^{\mathbf{N}^{\prime}} \subset \mathbf{R}, \varepsilon \in\{0,1\}$, let the term $\mathrm{II}_{n}(\varepsilon)$ be defined by (3.3). Then

$$
\begin{array}{r}
\lim _{z \rightarrow 0}\left\langle\Phi_{\mathrm{N}}\left(z \int_{\mathrm{S}_{k} / z^{2}}^{\mathrm{T}_{k} / z^{2}} \mathrm{~S}_{u} f_{k} d u, k=1, \ldots, \mathrm{~N}\right), \int_{0}^{t / z^{2}} d t_{1} \int_{0}^{t_{1}} d t_{2} \ldots \int_{0}^{t_{n-1}} d t_{n}\right. \\
\left.\mathrm{II}_{n}(\varepsilon) \Phi_{\mathrm{N}^{\prime}}\left(z \int_{\mathrm{S}_{k}^{\prime} / z^{2}}^{\mathrm{T}_{k}^{\prime} / z^{2}} \mathrm{~S}_{u} f_{k}^{\prime} d u, k=1, \ldots, \mathrm{~N}^{\prime}\right)\right\rangle=0 \tag{3.8}
\end{array}
$$

Proof. - By the definition of $\mathrm{II}_{n}(\varepsilon)[$ see (3.3)] and letting the creation, annihilation operators in $\mathrm{II}_{n}(\varepsilon)$ act on the number vectors in the left hand side of (3.8), one shows that the module of the scalar product in the left hand side of (3.8) is dominated by

$$
\begin{align*}
& \sum_{m=0}^{n-1} \sum_{2 \leqq q_{1}<\ldots<q_{m} \leqq n} \sum_{\left(p_{1}, q_{1}, \ldots, p_{m}, q_{m}\right)}^{\prime} z^{2(n-m)} \int_{0}^{t / z^{2}} d t_{1} \int_{0}^{t_{1}} d t_{2} \ldots \int_{0}^{t_{n-1}} d t_{n} \\
& \prod_{h=1}^{m}\left|\left\langle S_{t_{p_{h}}} g_{1-\varepsilon\left(p_{h}\right)}, S_{t_{q_{h}}} g_{\varepsilon\left(q_{h}\right)}\right\rangle\right| \\
& \times \sum_{1 \leqq \alpha_{1}, \ldots, \alpha_{m} \leqq \mathrm{~N}, 1 \leqq \beta_{1}, \ldots, \beta_{m} \leqq \mathrm{~N}^{\prime}} \sigma\left(\left\{\alpha_{j}, \beta_{j}\right\}, \mathrm{N}, \mathrm{~N}^{\prime}, m\right) \\
& \prod_{h=1}^{n-m} \int_{S_{\alpha_{h} / z^{2}}}^{\mathrm{T}_{\alpha_{h} / z^{2}}}\left|\left\langle\mathrm{~S}_{u} f_{\alpha_{h}}, \mathrm{~S}_{t_{\alpha_{h}}} g_{\varepsilon\left(\alpha_{h}\right)}\right\rangle\right| \\
& \times \prod_{h=1}^{n-m}\left|\left\langle\mathrm{~S}_{t_{\beta_{h}}} g_{1-\varepsilon\left(\alpha_{h}\right)}, \int_{\mathrm{S}_{\mathrm{B}_{k}}^{\prime} / z^{2}}^{\mathrm{T}_{\beta_{h}}^{\prime} / z^{2}} \mathrm{~S}_{u} f_{\beta_{h}}^{\prime}\right\rangle\right| \tag{3.9}
\end{align*}
$$

where, $\sigma\left(\left\{\alpha_{j}, \beta_{j}\right\}, \mathrm{N}, \mathrm{N}^{\prime}, m\right)$ is the modulus of the scalar product of a pair of collective number vectors, i.e.

$$
\begin{aligned}
& \mid\left\langle\Phi_{\mathrm{N}-m}\left(z \int_{\mathrm{S}_{\alpha} / z^{2}}^{\mathrm{T}_{\alpha} / z^{2}} \mathrm{~S}_{u} f_{\alpha} d u, \alpha \in\{1, \ldots, \mathrm{~N}\} \backslash\left\{\alpha_{h}\right\}_{h=1}^{m}\right),\right. \\
& \left.\Phi_{\mathrm{N}^{\prime}-m}\left(z \int_{\mathrm{R}_{\beta}^{\prime} / z^{2}}^{\mathrm{T}_{\beta}^{\prime} / z^{2}} \mathrm{~S}_{u} d u f_{\beta}^{\prime}, \beta \in\left\{1, \ldots, \mathrm{~N}^{\prime}\right\} \backslash\left\{\beta_{h}\right\}_{h=1}^{m}\right)\right\rangle
\end{aligned}
$$

hence, by Theorem (2.1) a convergent, and therefore bounded quantity, as $z \rightarrow 0$.

The factor in the last line of (3.9) is majorized by

$$
\begin{equation*}
\left(\max _{\underset{F \in\left\{f_{h}\right\}_{h=1}^{N} \cup\left\{f_{h}^{\prime}\right\}_{h=1}^{N^{\prime}}, \mathrm{G} \in\left\{g_{0}, g_{1}\right\}}{ }} \int_{-\infty}^{\infty}\left|\left\langle\mathrm{F}, \mathrm{~S}_{t} \mathrm{G}\right\rangle\right| d t\right)^{2(n-m)} \tag{3.10}
\end{equation*}
$$

The factor given by the first two lines in (3.9), up to a constant, is the same as the right hand side of (3.16) of [1] and there we have proved that it tends, as $z \rightarrow 0$, to zero. Thus the thesis follows.

In order to compute the limit of the type I terms we rewrite the term $\mathrm{I}_{n}(\varepsilon)$ in another form in which the exponent of the factor -1 has an expression much clearer than formula (3.3).

Lemma (3.3). - For each $n \in \mathbf{N}, \varepsilon \in\{0,1\}^{n}$

$$
\begin{align*}
& \mathrm{I}_{n}(\varepsilon)=\sum_{m=1}^{n} \sum_{1=q_{1}<q_{2}<\ldots<q_{m} \leqq n}(-1)^{(1 / 2) m(m-1)} \\
& \times \prod_{\alpha \in\{1, \ldots, n\} \backslash\left\{q_{h}\right\}_{h=1}^{m}}\left\langle\mathrm{~S}_{t_{\alpha-1}} g_{1-\varepsilon(\alpha-1)}, \mathrm{S}_{t_{\alpha}} g_{\varepsilon(\alpha)}\right\rangle \\
& \prod_{k_{h=1}^{m}}^{m} \mathrm{~A}^{+}\left(S_{t_{q_{h}}} g_{\varepsilon\left(q_{h}\right)}\right) \cdot \prod_{h=1}^{m} \mathrm{~A}\left(\mathrm{~S}_{t_{q_{h+1}-1}} g_{1-\varepsilon\left(q_{h+1}-1\right)}\right)
\end{align*}
$$

where, $q_{m+1}:=n+1$.
Proof. - It is clear that when we bring the product (3.2) to the normal ordered form, there will exist $m(\leqq n)$ creators not used to produce the scalar products with annihilators. Moreover in the product (3.2), $\mathrm{A}^{+}\left(\mathrm{S}_{t_{1}} g_{\varepsilon(1)}\right)$ is in ordered position, so $m \geqq 1$. Label the remaining creators with $\left\{q_{h}\right\}_{h=1}^{m}$. This means that the creators

$$
\begin{equation*}
\left\{\mathrm{A}^{+}\left(\mathrm{S}_{t_{\alpha}} g_{\varepsilon(\alpha)}\right) ; \alpha \in\{1, \ldots, n\} \backslash\left\{q_{h}\right\}_{h=1}^{m}\right\} \tag{3.12}
\end{equation*}
$$

have been used to produce scalar products with the annihilators

$$
\begin{align*}
\left\{\mathrm{A}\left(\mathrm{~S}_{t_{\boldsymbol{x}-1}} g_{1-\varepsilon(\alpha-1)}\right) ;\right. & \left.\alpha \in\{1, \ldots, n\} \backslash\left\{q_{h}\right\}_{h=1}^{m}\right\} \\
& =\left\{\mathrm{A}\left(\mathrm{~S}_{t_{\mathbf{\alpha}}} g_{1-\varepsilon(\alpha)}\right) ; \alpha \in\{1, \ldots, n\} \backslash\left\{q_{h}\right\}_{h=1}^{m}\right\} \tag{3.13}
\end{align*}
$$

i.e. the remaining annihilators are

$$
\begin{align*}
\left\{\mathrm{A}\left(\mathrm{~S}_{t_{\alpha}} g_{1-\varepsilon(\alpha)}\right) ; \alpha \in\{1, \ldots, n\} \backslash\right. & \left.\left\{\{1, \ldots, n\} \backslash\left\{q_{h}\right\}_{h=1}^{m}-1\right\}\right\} \\
& =\left\{\mathrm{A}\left(\mathrm{~S}_{t_{q_{h+1}-1}} g_{1-\varepsilon\left(q_{h+1}-1\right)}\right)\right\}_{h=1}^{m} \tag{3.14}
\end{align*}
$$

The factor $(-1)^{(1 / 2) m(m-1)}$ comes from the following exchanges:
$\mathrm{A}\left(\mathrm{S}_{t_{q_{m-1}}} g_{1-\varepsilon\left(q_{m}-1\right)}\right)$ with $\mathrm{A}^{+}\left(\mathrm{S}_{t_{q_{m}}} g_{\varepsilon\left(q_{m}\right)}\right)$ (this gives the factor - 1$)$;
$\mathrm{A}\left(\mathrm{S}_{t_{q_{m-1}-1}} g_{1-\varepsilon\left(q_{m-1}-1\right.}\right) \quad$ with $\mathrm{A}^{+}\left(\mathrm{S}_{t_{q_{m-1}}} g_{\varepsilon\left(q_{m-1}\right)}\right) \mathrm{A}^{+}\left(\mathrm{S}_{t_{q_{m}}} g_{\varepsilon\left(q_{m}\right)}\right) \quad$ (this gives the factor $\left.(-1)^{2}\right) ; \ldots$;
$\mathrm{A}\left(\mathrm{S}_{\mathrm{t}_{q_{2}-1}} g_{1-\varepsilon\left(q_{2}-1\right)}\right)$ with $\mathrm{A}^{+}\left(\mathrm{S}_{t_{q_{2}}} g_{\varepsilon\left(q_{2}\right)}\right) \ldots \mathrm{A}^{+}\left(S_{t_{q_{m}}} g_{\varepsilon\left(q_{m}\right)}\right)$ (this gives the factor $\left.(-1)^{m-1}\right)$.

Theorem (3.4). - For each $\mathbf{N}, \quad \mathbf{N}^{\prime} \in \mathbf{N}, \quad n \in \mathbf{N}, \quad f_{1}, \ldots, f_{\mathbf{N}}$, $f_{1}^{\prime}, \ldots, f_{\mathbf{N}^{\prime}}^{\prime} \in \mathrm{K},\left\{\mathrm{S}_{h}, \mathrm{~T}_{h}\right\}_{h=1}^{\mathrm{N}},\left\{\mathrm{S}_{h}^{\prime}, \mathrm{T}_{h}^{\prime}\right\}_{h=1}^{\mathbf{N}^{\prime}} \subset \mathbf{R}, \varepsilon \in\{0,1\}$, the limit

$$
\begin{array}{r}
\lim _{z \rightarrow 0}\left\langle\Phi_{\mathrm{N}}\left(z \int_{\mathrm{S}_{k} / z^{2}}^{\mathrm{T}_{k} / z^{2}} \mathrm{~S}_{u} f_{k} d u, k=1, \ldots, \mathrm{~N}\right), \int_{0}^{t / z^{2}} d t_{1} \int_{0}^{t_{1}} d t_{2} \ldots \int_{0}^{t_{n-1}} d t_{n}\right. \\
\left.\mathrm{I}_{n}(\varepsilon) \Phi_{\mathrm{N}^{\prime}}\left(z \int_{\mathrm{S}_{k}^{\prime} / z^{2}}^{\mathrm{T}_{k}^{\prime} / z^{2}} \mathrm{~S}_{u} f_{k}^{\prime} d u, k=1, \ldots, \mathrm{~N}^{\prime}\right)\right\rangle \tag{3.15}
\end{array}
$$

exists and is equal to

$$
\begin{align*}
& \sum_{m=1}^{n} \sum_{1=q_{1}<q_{2}<\ldots<q_{m} \leqq n} \prod_{r=1}^{m} \prod_{k=q_{r}+1}^{q_{r}+\boldsymbol{1}-1}\left(q_{1-\varepsilon(h-1)} \mid g_{\varepsilon(k)}\right) \\
& -\int_{0 \leqq t_{q_{m} \leq t_{q_{m-1}} \leqq} \leqq \leqq \tau_{\boldsymbol{q}_{1} \leqq t}} d t_{q_{m}} \ldots d t_{q_{1}} \\
& \sum_{1 \leqq x_{1}, \ldots, x_{m} \leqq N} \prod_{h=1}^{m}(-1)^{\left(x_{k}, N\right)} \chi_{\mid S_{x_{k}}, T_{x_{k}}}\left(t_{q_{k}}\right)\left(f_{x_{k}} \mid g_{\varepsilon\left(q_{k}\right)}\right) \\
& \left|\left\{x_{\boldsymbol{h}}\right\}_{h=1}^{m}\right|=m \\
& \sum_{1 \leqq y_{1}, \ldots, y_{m} \leqq \mathrm{~N}} \prod_{h=1}^{m}(-1)^{\left(y_{h} N^{N}\right)} \chi_{\left[S_{g_{h}}^{\prime}, T_{y_{k}}^{\prime} \mid\right.}\left(t_{q_{h}}\right)\left(g_{1-\varepsilon\left(q_{h+1}-1\right)} \mid f_{y_{h}}^{\prime}\right) \\
& \left|\left\{y_{h}\right\}_{h=1}^{m}\right|=m \\
& \left\langle\Psi_{N-m}\left(\chi_{\left[S_{\alpha}, T_{a l}\right]} \otimes f_{\alpha}, \alpha \in\{1, \ldots, N\} \backslash\left\{x_{h}\right\}_{h=1}^{m}\right),\right. \\
& \left.\Psi_{N^{\prime}-m}\left(\chi_{\left[S_{\alpha}^{\prime}, r_{a}^{\prime}\right]} \otimes f_{\alpha}^{\prime}, \alpha \in\left\{1, \ldots, N^{\prime}\right\} \backslash\left\{y_{h}\right\}_{h=1}^{m}\right)\right\rangle \tag{3.16}
\end{align*}
$$

where $\Psi$ is the vacuum vector of $\Gamma\left(\mathrm{L}^{2}(\mathbf{R} ; d t, \mathrm{~K})\right)$,

$$
\left(x_{h}, \mathbf{N}\right):=\left|\left\{1, \ldots, x_{h}\right\} \backslash\left\{x_{\alpha}\right\}_{\alpha=1}^{h-1}\right|
$$

and for $f, g \in \mathrm{~K}$ the half-scalar product $(f \mid g)_{-}$is defined by

$$
\begin{equation*}
(f \mid g)_{-}:=\int_{-\infty}^{0} d t\left\langle f, \mathrm{~S}_{t} g\right\rangle \tag{3.16a}
\end{equation*}
$$

Proof. - Clearly, for each $n \in \mathbf{N}, m \leqq n, 1=q_{1}<q_{2}<\ldots<q_{m} \leqq n$, $q_{m+1}:=n+1$

$$
\begin{equation*}
\{1, \ldots, n\} \backslash\left\{q_{h}\right\}_{h=1}^{m}=\bigcup_{r=1}^{m}\left\{q_{r}+1, \ldots, q_{r+1}-1\right\} \tag{3.17}
\end{equation*}
$$

So, one can rewite the product of scalar products in the right hand side of (3.11) in the form:

$$
\begin{align*}
& \prod_{\alpha \in\{1, \ldots, n\} \backslash\left\{q_{h} m_{h=1}^{m}\right.}\left\langle\mathrm{S}_{t_{\alpha-1}} g_{1-\varepsilon(\alpha-1)}, \mathrm{S}_{t_{\alpha}} g_{\varepsilon(\alpha)}\right\rangle \\
&=\prod_{r=1}^{m} \prod_{h=q_{r}+1}^{q_{r}+1-1}\left\langle\mathrm{~S}_{t_{h-1}} g_{1-\varepsilon(h-1)}, \mathrm{S}_{t_{h}} g_{\varepsilon(h)}\right\rangle
\end{align*}
$$

Using (3.11) and (3.18) in (3.15) one finds that the limit (3.15) is equal to the limit of

$$
\begin{gathered}
\sum_{m=1}^{n} \sum_{1=q_{1}<q_{2}<\ldots<q_{m} \leqq n}(-1)^{(1 / 2) m(m-1)} z^{2 m} \int_{0}^{t / z^{2}} d t_{1} \int_{0}^{t_{2}} d t_{2} \ldots \int_{0}^{t_{n-1}} d t_{n} \\
\prod_{r=1}^{m} \prod_{h=q_{r}+1}^{q_{r}+1-1}\left\langle\mathrm{~S}_{t_{h-1}} g_{1-\varepsilon(h-1)}, \mathrm{S}_{t_{h}} g_{\varepsilon(h)}\right\rangle
\end{gathered}
$$

$$
\begin{gather*}
\left\langle\Phi_{\mathrm{N}}\left(z \int_{\mathrm{S}_{k} / z^{2}}^{\mathrm{T}_{k} / z^{2}} \mathrm{~S}_{u} f_{k} d u, k=1, \ldots, \mathrm{~N}\right), \int_{0}^{t / z^{2}} d t_{1} \int_{0}^{t_{1}} d t_{2} \ldots \int_{0}^{t_{n-1}} d t_{n}\right. \\
\prod_{h=1}^{m} \mathrm{~A}^{+}\left(\mathrm{S}_{t_{q_{h}}} g_{\varepsilon\left(q_{h}\right)}\right) \cdot \prod_{h=1}^{m} \mathrm{~A}\left(\mathrm{~S}_{t_{q_{h+1}-1}} g_{1-\varepsilon\left(q_{h+1}-1\right)}\right) \\
\left.\Phi_{\mathrm{N}^{\prime}}\left(z \int_{\mathrm{S}_{k}^{\prime} / z^{2}}^{\mathrm{T}_{k}^{\prime} / z^{2}} \mathrm{~S}_{u} f_{k}^{\prime} d u, k=1, \ldots, \mathrm{~N}^{\prime}\right)\right\rangle \tag{3.19}
\end{gather*}
$$

Letting the creators in (3.19) act on the number vectors in the left hand side of the scalar product, one has

$$
\begin{align*}
& \prod_{h=m}^{1} \mathrm{~A}^{+}\left(\mathrm{S}_{t_{q_{h}}} g_{\varepsilon\left(q_{h}\right)}\right) \Phi_{\mathrm{N}}\left(z \int_{\mathrm{S}_{k} / z^{2}}^{\mathrm{T}_{k} / z^{2}} \mathrm{~S}_{u} f_{k} d u, k=1, \ldots, \mathrm{~N}\right) \\
& =\sum_{\substack{m \leqq x_{1}, \ldots, x_{m} \leq \mathrm{N} \\
\left|\left\{x_{h}\right\}_{h=1}^{m}\right|=m}} \prod_{h=1}^{m}(-1)^{\left(x_{h}, \mathrm{~N}\right)} \int_{\mathrm{S}_{k} / z^{2}}^{\mathrm{T}_{k} / z^{2}}\left\langle\mathrm{~S}_{u} f_{x_{h}}, \mathrm{~S}_{t_{q_{h}}} g_{\varepsilon\left(q_{h}\right)}\right\rangle d u \\
& \quad \Phi_{\mathrm{N}-m}\left(z \int_{\mathrm{S}_{\alpha} / z^{2}}^{\mathrm{T}_{\alpha} / z^{2}} \mathrm{~S}_{u} f_{\alpha} d u, \alpha \in\{1, \ldots, \mathrm{~N}\} \backslash\left\{x_{h}\right\}_{h=1}^{m}\right)
\end{align*}
$$

where we have used the symbol $\prod_{h=m}$ to denote the product of operators with decreasing time-indices. Similarly, letting the annihilators in (3.19) act on the $\Phi_{N^{\prime}}$-number vectors and changing their order, using the CAR, so to obtain a sequence of decreasing time-indices, we obtain the expression

$$
\begin{equation*}
(-1)^{m(m-1) / 2} \prod_{h=m}^{1} \mathrm{~A}\left(\mathrm{~S}_{t_{q_{q+1}-1}} g_{1-\varepsilon\left(q_{h+1}-1\right)}\right) \tag{3.21}
\end{equation*}
$$

acting on the $\Phi_{\mathbf{N}^{\prime}}$ - number vectors in (3.19). Now we can apply (3.20) and this leads to the result:

$$
\begin{align*}
& (-1)^{(1 / 2) m(m-1)} \sum_{\substack{1 \leq y_{1}, \ldots, y_{m} \leqq \mathrm{~N} \\
1\left\{y_{h}\right\}_{h=1}^{m} \mid=m}} \prod_{h=1}^{m}(-1)^{\left(y_{h}, \mathrm{~N}^{\prime}\right)} \int_{\mathrm{S}_{y_{h} / z^{2}}^{\prime}}^{\mathrm{T}_{y_{h} / z^{2}}^{\prime}} \\
& \times\left\langle\mathrm{S}_{t_{q_{h+1}-1}} g_{\varepsilon\left(q_{h+1}-1\right)}, \mathrm{S}_{v} f_{x_{h}}^{\prime}\right\rangle d v \\
& \left\langle\Phi_{\mathrm{N}^{\prime}-m}\left(z \int_{\mathrm{S}_{\beta}^{\prime} / z^{2}}^{\mathrm{T}_{\beta}^{\prime} / z^{2}} \mathrm{~S}_{u} f_{\beta}^{\prime} d u, \beta \in\left\{1, \ldots, \mathrm{~N}^{\prime}\right\} \backslash\left\{y_{h}\right\}_{h=1}^{m}\right)\right\rangle
\end{align*}
$$

Summing up, (3.19) is equal to

$$
\begin{align*}
& \sum_{m=1}^{n} \sum_{1=q_{1}<q_{2}<\ldots<q_{m} \leq n}(-1)^{1 / 2 m(m-1)} z^{2 m} \int_{0}^{t / z^{2}} d t_{1} \int_{0}^{t_{1}} d t_{2} \cdots \int_{0}^{t_{n}-1} d t_{n} \\
& \prod_{r=1}^{m} \prod_{h=q_{r}+1}^{q_{r+1}-1}\left\langle S_{t_{h-1}} g_{1-\varepsilon(h-1)}, S_{t_{h}} g_{\varepsilon(h)}\right\rangle \\
& \sum_{1 \leqq x_{1}, \ldots, x_{m} \leqq \mathrm{~N}} \prod_{h=1}^{m}(-1)^{\left(x_{k}, \mathbf{N}\right)} \int_{\mathbf{S}_{x_{h}} / z^{2}}^{\mathrm{T}_{x_{h} / z^{2}}}\left\langle\mathbf{S}_{u} f_{x_{h},} \mathbf{S}_{t_{q_{h}}} g_{\varepsilon\left(q_{h}\right)}\right\rangle d u \\
& \left|\left\{x_{h}\right\}_{h=1}^{m}\right|=m \\
& (-1)^{(1 / 2) m(m-1)} \sum_{1 \leqq y_{1}, \ldots, y_{m} \leqq N} \sum_{k=1}^{m}(-1)^{\left(y_{h^{*}} N^{\gamma}\right)} \\
& \left|\left\{y_{h}\right\}_{h=1}^{m}\right|=m \\
& \times \int_{\mathrm{S}_{y_{h} / z}^{\prime}}^{\mathrm{T}_{y_{h} / z^{2}}^{\prime}}\left\langle\mathrm{S}_{t_{q_{k+1}-1}} g_{\varepsilon\left(q_{h+1}-1\right)}, \mathrm{S}_{v} f_{x_{h}}^{*}\right\rangle d v \\
& \left\langle\Phi_{\mathbf{N}-m}\left(z \int_{\mathbf{S}_{\alpha} / z^{2}}^{\mathrm{T}_{\alpha} / z^{2}} \mathbf{S}_{u} f_{\alpha} d u, \alpha \in\{1, \ldots, \mathbf{N}\} \backslash\left\{x_{h}\right\}_{h=1}^{m}\right)\right. \\
& \left.\Phi_{\mathbf{N}^{\prime}-m}\left(z \int_{\mathrm{S}_{\beta}^{\prime} / z^{2}}^{\mathrm{T}_{\beta}^{\prime} / z^{2}} \mathrm{~S}_{u} f_{\beta}^{\prime} d u, \beta \in\left\{1, \ldots, \mathbf{N}^{\prime}\right\} \backslash\left\{y_{h}\right\}_{h=1}^{m}\right)\right\rangle \tag{3.23}
\end{align*}
$$

By Theorem (2.1) the last scalar product in (3.23) tends to

$$
\begin{align*}
&\left\langle\Psi_{\mathrm{N}-m}\left(\chi_{\left[\mathbf{S}_{\alpha}, \mathbf{T}_{\alpha}\right]} \otimes f_{\alpha}, \alpha \in\{1, \ldots, \mathbf{N}\} \backslash\left\{x_{h}\right\}_{h=1}^{m}\right),\right. \\
&\left.\Psi_{\mathbf{N}^{\prime}-m}\left(\chi_{\left[\mathbf{S}_{\alpha}^{\prime}, \mathbf{T}_{\alpha}^{\prime}\right]} \otimes f_{\alpha}^{\prime}, \alpha \in\left\{1, \ldots, \mathbf{N}^{\prime}\right\} \backslash\left\{y_{h}\right\}_{h=1}^{m}\right)\right\rangle \tag{3.24}
\end{align*}
$$

and the same arguments as in the proof of Lemma (3.4) of [1] show that the $t$-integral term in (3.27) tends to

$$
\begin{array}{r}
\left(g_{1-\varepsilon(h-1)} \mid g_{\varepsilon(h)}\right) \\
-\int_{0 \leqq t_{q_{m} \leqq t q_{q_{m-1}} \leqq \ldots \leqq t_{q_{1}} \leqq t} d t_{q_{m}} \ldots d t_{q_{1}} \chi_{\left[\mathrm{s}_{x_{h}}, \mathrm{~T}_{x_{h}}\right.}\left(t_{q_{h}}\right)\left(\mathrm{f}_{x_{h}} \mid g_{\varepsilon\left(q_{h}\right)}\right)}^{\chi_{\left[\mathrm{S}_{y_{h}}^{\prime}, \mathrm{T}_{y_{h}}^{\prime}\right.}\left(t_{q_{h}}\right)\left(g_{1-\varepsilon\left(q_{h+1}-1\right)} \mid f_{y_{h}}^{\prime}\right)}
\end{array}
$$

This proves our result.

## 4. THE LIMIT OF THE NON-NEGLIGIBLE TERMS

In the previous section we have discussed the limit (1.19) for each fixed $n$ and our main results are Theorems (3.2) and (3.4). The present section
is devoted to investigate:
(1) the condition to exchange the limit $z \rightarrow 0$ with the sum over $n \in \mathbf{N}$;
(2) the explicit form of the limit.

In the following, we shall use the notation

$$
\begin{equation*}
\|g\|_{-}^{2}:=\max _{\varepsilon, \sigma \in\{0,1\}} \int_{-\infty}^{0}\left|\left\langle g_{\varepsilon}, S_{t} g_{\sigma}\right\rangle\right| d t \tag{4.1}
\end{equation*}
$$

Theorem (4.1). - For each $n, \mathbf{N}, \mathbf{N}^{\prime} \in \mathbf{N},\left\{f_{h}\right\}_{h=1}^{\mathbf{N}},\left\{f_{h}^{\prime}\right\}_{h=1}^{\mathbf{N}^{\prime}} \supset \mathbf{K}$,

$$
\begin{align*}
& \sum_{\varepsilon \in\{0,1\}^{n}} \int_{0}^{t / z^{2}} d t_{1} \int_{0}^{t_{1}} d t_{2} \ldots \int_{0}^{t_{n-1}} \\
& \times d t_{n} \mid\left\langle\Phi_{\mathrm{N}}\left(z \int_{\mathrm{S}_{k} / z^{2}}^{\mathrm{T}_{k} / z^{2}} \mathrm{~S}_{u} f_{k} d u, k=1, \ldots, \mathrm{~N}\right)\right. \text {, } \\
& \left.\left(\mathrm{I}_{n}(\varepsilon)+\mathrm{II}_{n}(\varepsilon)\right) \Phi_{\mathrm{N}^{\prime}}\left(z \int_{\mathrm{S}_{k}^{\prime} / z^{2}}^{\mathrm{T}_{k}^{\prime} / z^{2}} \mathrm{~S}_{u} f_{k}^{\prime} d u, k=1, \ldots, \mathrm{~N}^{\prime}\right)\right\rangle \mid \\
& \leqq n \cdot 16^{n} \cdot \mathrm{C}\left(\mathrm{~N}, \mathrm{~N}^{\prime},\left\{f_{h}\right\}_{h=1}^{\mathrm{N}},\left\{f_{h}^{\prime}\right\}_{h=1}^{\mathrm{N}^{\prime}}\right) \max _{0 \leqq m \leqq n}\left(\frac{t^{n-m}}{(n-m)!} \cdot\|g\|_{-}^{2 m}\right. \\
& \left.\times\left[\max _{G=g_{0}, g_{1}, \mathrm{~F} \in\left\{f_{h}\right\}_{h=1}^{N} \cup\left\{f_{h}^{\prime}\right\}_{N^{\prime}=1}^{N^{\prime}}} \int_{-\infty}^{\infty}\left|\left\langle\mathrm{F}, \mathrm{~S}_{u} \mathrm{G}\right\rangle\right| d u\right]^{2(n-m)}\right) \tag{4.2}
\end{align*}
$$

where,

$$
\begin{array}{r}
\mathrm{C}\left(\mathrm{~N}, \mathrm{~N}^{\prime},\left\{f_{h}\right\}_{h=1}^{\mathrm{N}},\left\{f_{h}^{\prime}\right\}_{h=1}^{\mathrm{N}^{\prime}}\right):=\sup _{z>0} \max _{\substack{ }} \sum_{\substack{ \\
1 \leqq x_{1}, \ldots, x_{m} \leqq \mathrm{~N} \\
\left|\left\{x_{h}\right\}_{h=1}^{m}\right|=m}} \sum_{1 \leqq y_{1}, \ldots, y_{m} \leqq \mathrm{~N}}^{\left|\left\{y_{h}\right\}_{h=1}^{m}\right|=m} \\
\mid\left\langle\Phi_{\mathrm{N}-m}\left(z \int_{\mathrm{S}_{r} / z^{2}}^{\mathrm{T}_{r} / z^{2}} \mathrm{~S}_{u} f_{r} d u, r \in\{1, \ldots, \mathrm{~N}\} \backslash\left\{x_{h}\right\}_{h=1}^{m}\right),\right. \\
\\
\left.\Phi_{\mathbf{N}^{\prime}-1}\left(z \int_{\mathrm{S}_{r}^{\prime} / z^{2}}^{\mathrm{T}_{r}^{\prime} / z^{2}} \mathrm{~S}_{u} f_{r}^{\prime} d u, r \in\left\{1, \ldots, \mathrm{~N}^{\prime}\right\} \backslash\left\{y_{h}\right\}_{h=1}^{m}\right)\right\rangle \mid \tag{4.3}
\end{array}
$$

Proof. - By formula (3.3) and using the notation (4.3), we know that the left hand side of (4.2) is majorized by

$$
\begin{align*}
& \sum_{\varepsilon \in\{0,1\}^{n}} \sum_{m=0}^{n-1} \sum_{2 \leqq q_{1}<\ldots<q_{m} \leqq n} \sum_{1 \leqq p_{1}, \ldots, p_{m} \leqq n-1} \\
& p_{h}<q_{h}, h=1, \ldots, m,\left|\left\{p_{h}\right\}_{h=1}^{m}\right|=m \\
& \times z^{2(n-m)} \int_{0}^{t / z^{2}} d t_{1} \int_{0}^{t_{1}} d t_{2} \ldots \int_{0}^{t_{n-1}} d t_{n} \\
& \prod_{h=1}^{m}\left|\left\langle\mathrm{~S}_{t_{p_{h}}} g_{1-\varepsilon\left(p_{h}\right)}, \mathrm{S}_{t_{q_{h}}} g_{\varepsilon\left(q_{h}\right)}\right\rangle\right| \cdot \mathrm{C}\left(\mathrm{~N}, \mathrm{~N}^{\prime},\left\{f_{h}\right\}_{h=1}^{\mathrm{N}},\left\{f_{h}^{\prime}\right\}_{h=1}^{\mathrm{N}^{\prime}}\right) \tag{4.4}
\end{align*}
$$

this is the same, up to a constant, as the right hand side of (4.18) in [1], therefore the application of the same argument as in the proof of Lemma (4.3) of [1] leads to (4.2).

Combining together Theorem (4.1), Theorem (3.1), Theorem (3.2) and Theorem (3.4), one has the following

Theorem (4.2). - For each $\mathbf{N}, \mathbf{N}^{\prime} \in \mathbf{N}, f_{1}, \ldots, f_{\mathrm{N}}, f_{1}^{\prime}, \ldots, f_{\mathbf{N}^{\prime}}^{\prime} \in \mathrm{K}$, $\left\{\mathrm{S}_{h}, \mathrm{~T}_{h}\right\}_{h=1}^{\mathrm{N}},\left\{\mathrm{S}_{h}, \mathrm{~T}_{h}\right\}_{h=1}^{\mathrm{N}} \subset \mathbf{R}, u, v \in \mathrm{H}_{0}, \mathrm{D} \in \mathrm{B}\left(\mathrm{H}_{0}\right)$, if

$$
\begin{equation*}
\|g\|_{-}^{2}<\frac{1}{16\|\mathrm{D}\|} \tag{4.5}
\end{equation*}
$$

the limit (1.19) exists and is equal to

$$
\begin{align*}
& \left\langle u \otimes \Psi_{\mathrm{N}}\left(\chi_{\left[\mathrm{S}_{\alpha}, \mathrm{T}_{\alpha}\right]} \otimes f_{\alpha}, \alpha \in\{1, \ldots, \mathrm{~N}\}\right),\right. \\
& v \otimes \Psi_{\mathbf{N}^{\prime}}\left(\chi_{\left[\mathrm{S}_{\alpha}^{\prime}, \mathrm{T}_{\alpha}^{\prime}\right]} \otimes f_{\alpha}^{\prime}, \alpha \in\left\{1, \ldots, \mathrm{~N}^{\prime}\right\}\right\rangle \\
& +\sum_{n=1}^{\infty} \sum_{\varepsilon \in\{0,1\}^{n}} \sum_{m=1}^{n} \sum_{1=q_{1}<q_{2}<\ldots<q_{m} \leqq n} \prod_{r=1}^{m} \prod_{h=q_{r}+1}^{q_{r+1}-1}\left(g_{1-\varepsilon(h-1)} \mid g_{\varepsilon(h)}\right) \\
& -\int_{0 \leqq t_{q_{m} \leqq t} t_{q_{m-1}} \leqq \ldots \leqq t_{q_{1}} \leqq t} d t_{q_{m}} \ldots d t_{q_{1}}\left\langle u, \mathrm{D}_{\varepsilon(1)} \ldots \mathrm{D}_{\varepsilon(n)} v\right\rangle \\
& \sum_{1 \leqq x_{1}, \ldots, x_{m} \leqq \mathrm{~N}} \prod_{h=1}(-1)^{\left(x_{h}, \mathrm{~N}\right)} \chi_{\left[\mathrm{S}_{x_{h}}, \mathbf{x}_{x_{h}} \backslash\right.}\left(t_{q_{h}}\right)\left(f_{x_{h}} \mid g_{\varepsilon\left(q_{h}\right)}\right) \\
& \left|\left\{x_{h}\right\}_{h=1}^{m}\right|=m \\
& \sum_{1 \leqq y_{1}, \ldots, y_{m} \leqq \mathrm{~N}} \prod_{h=1}(-1)^{\left(y_{h}, \mathrm{~N}^{\prime}\right)} \chi_{\left[\mathrm{S}_{y_{h}}^{\prime}, \mathrm{T}_{\left.y_{h]}\right]}^{\prime}\right.}\left(t_{q_{h}}\right)\left(g_{1-\varepsilon\left(q_{h+1}-1\right)} \mid f_{y_{h}}^{\prime}\right) \\
& \left|\left\{y_{h}\right\}_{h=1}^{m}\right|=m \\
& \left\langle\Psi_{\mathrm{N}-m}\left(\chi_{\left[\mathrm{s}_{\alpha}, \mathrm{T}_{\alpha}\right]} \otimes f_{\alpha}, \alpha \in\{1, \ldots, \mathrm{~N}\} \backslash\left\{x_{h}\right\}_{h=1}^{m}\right),\right. \\
& \left.\Psi_{\mathbf{N}^{\prime}-m}\left(\chi_{\left[\mathrm{S}_{\alpha}^{\prime}, \mathrm{T}_{\alpha}^{\prime}\right]} \otimes f_{\alpha}^{\prime}, \alpha \in\left\{1, \ldots, \mathrm{~N}^{\prime}\right\} \backslash\left\{y_{h}\right\}_{h=1}^{m}\right)\right\rangle \tag{4.6}
\end{align*}
$$

Proof. - By expanding the product

$$
\begin{equation*}
(-i)^{n} \mathrm{~V}\left(t_{1}\right) \ldots \mathrm{V}\left(t_{n}\right) \tag{4.7}
\end{equation*}
$$

to

$$
\begin{align*}
\sum_{\varepsilon \in\{0,1\}^{n}} D_{\varepsilon(1)} \ldots D_{\varepsilon(m)} & \otimes A^{+}\left(S_{t_{1}} g_{\varepsilon(1)}\right) \\
& \times A\left(S_{t_{1}} g_{1-\varepsilon(1)}\right) \ldots A^{+}\left(S_{t_{m}} g_{\varepsilon(n)}\right) A\left(S_{t_{n}} g_{1-\varepsilon(n)}\right) \tag{4.8}
\end{align*}
$$

one can write the scalar product in (1.19) in the form

$$
\begin{align*}
& \sum_{n=0}^{\infty} \sum_{\varepsilon \in\{0,1\}^{n}} \int_{0}^{t / z^{2}} d t_{1} \int_{0}^{t_{1}} d t_{2} \ldots \int_{0}^{t_{n}-1} \\
& \quad \times d t_{n}\left\langle\Phi_{\mathrm{N}}\left(z \int_{\mathbf{D}_{k} / z^{2}}^{\mathrm{T}_{k} / z^{2}} \mathrm{~S}_{u} f_{k} d u, k=1, \ldots, \mathrm{~N}\right)\right. \\
& \left.\quad\left(\mathrm{I}_{n}(\varepsilon)+\mathrm{II}_{n}(\varepsilon)\right) \Phi_{\mathrm{N}}\left(z \int_{\mathrm{S}_{k}^{\prime} / z^{2}}^{\mathrm{T}_{k}^{\prime} / z^{2}} \mathrm{~S}_{u} f_{k}^{\prime} d u, k=1, \ldots, \mathrm{~N}^{\prime}\right)\right\rangle \\
& \times\left\langle u, \mathrm{D}_{\varepsilon(1)} \ldots \mathrm{D}_{\varepsilon(n)} v\right\rangle \tag{4.9}
\end{align*}
$$

Applying Theorem (4.1) to (4.9), one knows that if $\|g\|_{-}^{2}<1 / 16\|D\|$, the limit (1.22) is equal to

$$
\begin{align*}
& \sum_{n=0}^{\infty} \lim _{z \rightarrow 0} \sum_{\varepsilon \in\{0,1} \int_{\eta^{n}} \int_{0}^{t / z^{2}} d t_{1} \int_{0}^{t_{1}} d t_{2} \ldots \int_{0}^{t_{n-1}} d t_{n} \\
&\left\langle u, \mathrm{D}_{\varepsilon(1)} \ldots \mathrm{D}_{\varepsilon(n)} v\right\rangle\left\langle\Phi_{\mathrm{N}}\left(z \int_{\mathrm{S}_{k} / z^{2}}^{\mathrm{T}_{k} / z^{2}} \mathrm{~S}_{u} f_{k} d u, k=1, \ldots, \mathrm{~N}\right),\right. \\
&\left.\left(\mathrm{I}_{n}(\varepsilon)+\mathrm{II}_{n}(\varepsilon)\right) \Phi_{\mathrm{N}}\left(z \int_{\mathrm{S}_{k}^{\prime} / z^{2}}^{\mathrm{T}_{k}^{\prime} / z^{2}} \mathrm{~S}_{u} f_{k}^{\prime} d u, k=1, \ldots, \mathrm{~N}^{\prime}\right)\right\rangle \tag{4.10}
\end{align*}
$$

By application of Theorem (3.2) and Theorem (3.3) we finish the proof.

## 5. THE QUANTUM STOCHASTIC DIFFERENTIAL EQUATION

From the Sections $\S 2, \S 3$ and $\S 4$ one has learnt
(1) the limit space on which our limit processes lives;
(2) the conditions allowing to take the limit in (1.19);
(1) the explicit form of the limit (1.19).

Now we want to describe the quantum stochastic process arising in the limit (1.19).

First of all notice that for each $\mathrm{N}, \mathrm{N}^{\prime} \in \mathbf{N}, f_{1}, \ldots, f_{\mathrm{N}}, f_{1}^{\prime}, \ldots, f_{\mathbf{N}^{\prime}}^{\prime} \in \mathrm{K}$, $\left\{\mathrm{S}_{h}, \mathrm{~T}_{h}\right\}_{h=1}^{\mathrm{N}},\left\{\mathrm{S}_{h}, \mathrm{~T}_{h}\right\}_{h=1}^{\mathrm{N}} \subset \mathbf{R}, u, v \in \mathrm{H}_{0}, \mathrm{D} \in \mathrm{B}\left(\mathrm{H}_{0}\right)$, the scalar product in
(1.19) can be written as

$$
\begin{equation*}
\left\langle u, \mathrm{~F}_{z}\left(t ; \mathrm{N}, \mathrm{~N}^{\prime} ;\binom{f_{1}, \ldots, f_{\mathrm{N}}}{f_{1}^{\prime}, \ldots, f_{\mathrm{N}^{\prime}}^{\prime}}\right)\right\rangle \tag{5.1}
\end{equation*}
$$

and its limit i.e. (4.6) can be written in the form

$$
\begin{equation*}
\left\langle u, \mathrm{~F}\left(t ; \mathrm{N}, \mathrm{~N}^{\prime} ;\binom{f_{1}, \ldots, f_{\mathrm{N}}}{f_{1}^{\prime}, \ldots, f_{\mathrm{N}^{\prime}}^{\prime}}\right)\right\rangle \tag{5.2}
\end{equation*}
$$

It is clear that both expressions are bounded.
In the following we introduce the following notations: for $\sigma \in\{0,1\}$

$$
\begin{gather*}
\mathrm{D}_{g}(\sigma):=\sum_{n=0}^{\infty}\left(g_{1-\sigma} \mid g_{1-\sigma}\right)_{-}^{n}\left(g_{\sigma} \mid g_{\sigma}\right)_{-}^{n}\left(\mathrm{D}_{\sigma} \mathrm{D}_{1-\sigma}\right)^{n}  \tag{5.3}\\
\mathrm{D}_{1}(\sigma):=\mathrm{D}_{g}(\sigma) \mathrm{D}_{\sigma}, \quad \mathrm{D}_{2}(\sigma):=\left(g_{1-\sigma} \mid g_{1-\sigma}\right)_{-} \mathrm{D}_{\sigma} \mathrm{D}_{1-\sigma} \mathrm{D}_{g}(\sigma) \tag{5.4}
\end{gather*}
$$

Our first and most important conclusion in this section is
Theorem (5.1). - For each $\mathbf{N}, \mathbf{N}^{\prime} \in \mathbf{N}, f_{1}, \ldots, f_{\mathbf{N}}, f_{1}^{\prime}, \ldots, f_{\mathbf{N}^{\prime}}^{\prime} \in \mathrm{K}$, $\left\{\mathrm{S}_{h}, \mathrm{~T}_{h}\right\}_{h=1}^{\mathrm{N}},\left\{\mathrm{S}_{h}, \mathrm{~T}_{h}\right\}_{h=1}^{\mathrm{N}} \subset \mathbf{R}, u, v \in \mathrm{H}_{0}, \mathrm{D} \in \mathrm{B}\left(\mathrm{H}_{0}\right)$, under the conditions (1.8), (1.9) and (4.5), the expressions (5.2) satisfy the system of differential equations

$$
\begin{align*}
& \left\langle u, \mathrm{~F}\left(t ; \mathrm{N}, \mathrm{~N}^{\prime} ;\binom{f_{1}, \ldots, f_{\mathrm{N}}}{f_{1}^{\prime}, \ldots, f_{\mathrm{N}^{\prime}}^{\prime}}\right)\right\rangle \\
& =\left\langle u \otimes \Psi_{\mathrm{N}}\left(\chi_{\left[\mathrm{S}_{\alpha}, \mathrm{T}_{\alpha}\right]} \otimes f_{\alpha}, \alpha \in\{1, \ldots, \mathrm{~N}\}\right),\right. \\
& v \otimes \Psi_{\mathbf{N}^{\prime}}\left(\chi_{\left[S_{\alpha}^{\prime}, \mathrm{T}_{\alpha}^{\prime}\right]} \otimes f_{\alpha}^{\prime}, \alpha \in\left\{1, \ldots, \mathrm{~N}^{\prime}\right\}\right\rangle \\
& +\int_{0}^{t} d s \sum_{\varepsilon \in\{0,1\}} \sum_{i=1}^{\mathbf{N}} \sum_{j=1}^{\mathbf{N}^{\prime}} \chi_{\left[S_{i}, \mathrm{~T}_{i}\right]}(s) \\
& \times \chi_{\left[\mathrm{S}_{j}^{\prime}, \mathrm{T}_{j}^{\prime}\right]}(s)\left(f_{i} \mid g_{\varepsilon}\right) \cdot\left(g_{1-\varepsilon} \mid f_{j}^{\prime}\right) \cdot(-1)^{i+j} \\
& \left\langle\left(\left(g_{\varepsilon} \mid f_{i}\right) \cdot\left(f_{j}^{\prime} \mid g_{1-\varepsilon}\right) \mathrm{D}_{1}^{+}(\varepsilon) u+\left(g_{\varepsilon} \mid f_{i}\right) \cdot\left(f_{j}^{\prime} \mid g_{\varepsilon}\right) \mathrm{D}_{2}^{+}(\varepsilon) u\right),\right. \\
& \left.\mathrm{F}\left(s ; \mathrm{N}-1, \mathrm{~N}^{\prime}-1 ;\binom{f_{1}, \ldots, \hat{f}_{i}, \ldots, f_{\mathrm{N}}}{f_{1}^{\prime}, \ldots, \hat{f}_{j}^{\prime}, \ldots, f_{\mathrm{N}^{\prime}}^{\prime}}\right)\right\rangle  \tag{5.5a}\\
& \left\langle u, \mathrm{~F}\left(0 ; \mathrm{N}, \mathrm{~N}^{\prime} ;\binom{f_{1}, \ldots, f_{\mathrm{N}}}{f_{1}^{\prime}, \ldots, f_{\mathbf{N}^{\prime}}^{\prime}}\right)\right\rangle \\
& \left\langle u \otimes \Psi_{\mathrm{N}}\left(\chi_{\left[\mathrm{S}_{\alpha}, T_{\alpha}\right]} \otimes f_{\alpha}, \alpha \in\{1, \ldots, \mathrm{~N}\}\right),\right. \\
& v \otimes \Psi_{\mathrm{N}^{\prime}}\left(\chi_{\left[S_{\alpha}^{\prime},,_{\alpha]}^{\prime}\right]} \otimes f_{\alpha}^{\prime}, \alpha \in\left\{1, \ldots \mathrm{~N}^{\prime}\right\}\right\rangle \tag{5.5b}
\end{align*}
$$

and

$$
\begin{equation*}
\langle u, \mathrm{~F}(t ; 0,0 ; 0)\rangle=\langle u, v\rangle \tag{5.5c}
\end{equation*}
$$

Remark. - This Theorem is the analogue of Theorem (5.10) of [1] and the two proofs are also similar. We shall not repeat the details of the proof but only give the main idea and outline the important steps.

Proof. - By the change of variable

$$
\begin{equation*}
z^{2} t_{1} \subseteq t_{1} \tag{5.6}
\end{equation*}
$$

in (1.22), one finds that (5.1) is equal to

$$
\begin{align*}
&\left\langle u \otimes \Phi_{\mathrm{N}}\left(z \int_{\mathrm{S}_{k} / z^{2}}^{\mathrm{T}_{k} / z^{2}} \mathrm{~S}_{u} f_{k} d u, k=1, \ldots, \mathrm{~N}\right),\right. \\
&\left.v \otimes \Phi_{\mathrm{N}^{\prime}}\left(z \int_{\mathrm{S}_{k}^{\prime} / z^{2}}^{\mathrm{T}_{k}^{\prime} / z^{2}} \mathrm{~S}_{u} f^{\prime}{ }_{k} d u, k=1, \ldots, \mathrm{~N}^{\prime}\right)\right\rangle \\
&+\left\langle u \otimes \Phi_{\mathrm{N}}\left(z \int_{\mathrm{S}_{k} / z^{2}}^{\mathrm{T}_{k} / z^{2}} \mathrm{~S}_{u} f_{k} d u, k=1, \ldots, \mathrm{~N}\right),\right. \\
& z^{-2} \sum_{n=1}^{\infty} \int_{0}^{t} d t_{1}(-i) \mathrm{V}\left(t_{1} / z^{2}\right) \\
& \int_{0}^{t_{1} / z^{2}} d t_{2} \ldots \int_{0}^{t_{n-1}} d t_{n}(-i)^{n-1} \mathrm{~V}\left(t_{2}\right) \ldots \\
&\left.\times \mathrm{V}\left(t_{n}\right) \Phi_{\mathrm{N}^{\prime}}\left(z \int_{\mathrm{S}_{k}^{\prime} / z^{2}}^{\mathrm{T}_{k}^{\prime} / z^{2}} \mathrm{~S}_{u} f_{k}^{\prime} d u, k=1, \ldots, \mathrm{~N}^{\prime}\right)\right\rangle \tag{5.7}
\end{align*}
$$

Using the explicit form (1.6) of the interaction for $\mathrm{V}\left(t_{1} / z^{2}\right)$ and the change of variables

$$
\begin{equation*}
m=n-1, \quad s_{1}=t_{2}, \ldots, s_{m}=t_{n-1} \tag{5.8}
\end{equation*}
$$

(5.7) becomes

$$
\begin{align*}
& \left\langle u \otimes \Phi_{\mathrm{N}}\left(z \int_{\mathrm{S}_{k} / z^{2}}^{\mathrm{T}_{k} / z^{2}} \mathrm{~S}_{u f_{k}} d u, k=1, \ldots, \mathrm{~N}\right),\right. \\
& \left.v \otimes \Phi_{\mathrm{N}^{\prime}}\left(z \int_{\mathrm{S}_{k}^{\prime} / z^{2}}^{\mathrm{T}_{k}^{\prime} / z^{2}} \mathrm{~S}_{u} f_{k}^{\prime} d u, k=1, \ldots, \mathrm{~N}^{\prime}\right)\right\rangle \\
& +z^{-2} \sum_{\varepsilon \in\{0,1\}} \int_{0}^{t} d t_{1}\left\langle\mathrm{D}_{\varepsilon}^{+} u \otimes \Phi_{\mathrm{N}}\left(z \int_{\mathrm{S}_{k} / z^{2}}^{\mathrm{T}_{k} / z^{2}} \mathrm{~S}_{u} f_{k} d u, k=1, \ldots, \mathrm{~N}\right),\right. \\
& 1 \otimes \mathrm{~A}^{+}\left(\mathrm{S}_{t_{1} / z^{2}} g_{\varepsilon}\right) \mathrm{A}\left(\mathrm{~S}_{t_{1} / z^{2}} g_{1-\varepsilon}\right) \\
& \left.\mathrm{U}_{t_{1} / z^{2}} \Phi_{\mathrm{N}^{\prime}}\left(z \int_{\mathrm{S}_{k}^{\prime} / z^{2}}^{\mathrm{T}_{k}^{\prime} / z^{2}} \mathrm{~S}_{u} f_{k}^{\prime} d u, k=1, \ldots, \mathrm{~N}^{\prime}\right)\right\rangle \tag{5.9}
\end{align*}
$$

The first term of (5.9) tends, as $z \rightarrow 0$, to

$$
\begin{align*}
& \left\langle u \otimes \Psi_{\mathrm{N}}\left(\chi_{\left[\mathrm{S}_{\alpha}, \mathrm{T}_{\alpha]}\right.} \otimes f_{\alpha}, \alpha \in\{1, \ldots, \mathrm{~N}\}\right),\right. \\
&  \tag{5.10}\\
& v \otimes \Psi_{\mathrm{N}^{\prime}}\left(\chi_{\left[\mathrm{s}_{\alpha}^{\prime}, \mathrm{T}_{\alpha}^{\prime}\right]}^{\prime} \otimes f_{\alpha}^{\prime}, \alpha \in\left\{1, \ldots, \mathrm{~N}^{\prime}\right\}\right\rangle
\end{align*}
$$

In the second term of (5.9), the action of the creator $\mathrm{A}^{+}\left(\mathrm{S}_{t_{1} / z^{2}} g_{\varepsilon}\right)$ on the $\Phi_{\mathbf{N}^{\prime}}$-number vector gives

$$
\begin{align*}
\sum_{i=1}^{\mathrm{N}} \int_{\mathrm{S}_{i} / z^{2}}^{\mathrm{T}_{i} / z^{2}}\left\langle\mathrm{~S}_{t_{1} / z^{2}} g_{\varepsilon}\right. & \left., \mathrm{S}_{u} f_{i}\right\rangle d u(-1)^{i} \\
& \times \Phi_{\mathrm{N}-1}\left(z \int_{\mathrm{S}_{k} / z^{2}}^{\mathrm{T}_{k} / z^{2}} \mathrm{~S}_{u} f_{k} d u, k \in\{1, \ldots, \mathrm{~N}\} \backslash\{i\}\right) \tag{5.11}
\end{align*}
$$

Therefore the second term of (5.9) is equal to

$$
\begin{align*}
& z^{-1} \sum_{i=1}^{\mathrm{N}} \sum_{\varepsilon \in\{0,1\}} \int_{0}^{t} d t_{1} \int_{\mathrm{S}_{i} / z^{2}}^{\mathrm{T}_{i} / z^{2}}\left\langle\mathrm{~S}_{t_{1} / z^{2}} g_{\varepsilon}, \mathrm{S}_{u} f_{i}\right\rangle d u .(-1)^{i} \\
& \quad\left\langle\mathrm{D}_{\varepsilon}^{+} u \otimes \Phi_{\mathrm{N}-1}\left(z \int_{\mathrm{S}_{k} / z^{2} \mathrm{~S}_{u}}^{\mathrm{T}_{k} / z^{2}} f_{k} d u, k \in\{1, \ldots, \mathrm{~N}\} \backslash\{i\}\right)\right. \\
& \left.1 \otimes \mathrm{~A}\left(\mathrm{~S}_{t_{1} / z^{2}} g_{1-\varepsilon}\right) \mathrm{U}_{t_{1} / z^{2}} \Phi_{\mathrm{N}^{\prime}}\left(z \int_{\mathrm{S}_{k}^{\prime} / z^{2}}^{\mathrm{T}_{k}^{\prime} / z^{2}} \mathrm{~S}_{u} f_{k}^{\prime} d u, k=1, \ldots, \mathrm{~N}^{\prime}\right)\right\rangle \tag{5.12}
\end{align*}
$$

The expression $1 \otimes \mathrm{~A}\left(\mathrm{~S}_{t_{1 / z}} g_{1-\varepsilon}\right) \mathrm{U}_{t_{1 / z}}$ is handled with the same techniques as in $[1, \ldots, 6]$. Namely: one expands $\mathrm{U}_{t_{1} / z^{2}}$ using the iterated series and after the change of variable $z^{2} \cdot t_{2} \varsigma t_{2}$, one finds

$$
\begin{align*}
1 \otimes \mathrm{~A}\left(\mathrm{~S}_{t_{1} / z^{2}} g_{1-\varepsilon}\right)+ & \sum_{n=2}^{\infty} \sum_{\varepsilon^{\prime} \in\{0,1\}} \frac{1}{z^{2}} \\
\times & \int_{0}^{t_{1}} d t_{2} \mathrm{D}_{\varepsilon^{\prime}} \otimes \mathrm{A}\left(\mathrm{~S}_{t_{1} / z^{2}} g_{1-\varepsilon}\right) \mathrm{A}^{+}\left(\mathrm{S}_{t_{2} / z^{2}} g_{\varepsilon^{\prime}}\right) \mathrm{A}\left(\mathrm{~S}_{t_{2} / z^{2}} g_{1-\varepsilon^{\prime}}\right) \\
& \int_{0}^{t_{2} / z^{2}} d t_{3} \ldots \int_{0}^{t_{n-1}} d t_{n}(-i)^{n-2} \mathrm{~V}\left(t_{3}\right) \ldots \mathrm{V}\left(t_{n}\right) \tag{5.13}
\end{align*}
$$

Moreover

$$
\begin{align*}
& \mathrm{A}\left(\mathrm{~S}_{t_{1 / z}} g_{1-\varepsilon}\right) \mathrm{A}^{+}\left(\mathrm{S}_{t_{2} / z^{2}} g_{\varepsilon^{\prime}}\right) \mathrm{A}\left(\mathrm{~S}_{\mathrm{t}_{2} / z^{2}} g_{1-\varepsilon^{\prime}}\right) \\
& =\left\langle\mathrm{S}_{t_{1} / z^{2}} g_{1-\varepsilon}, \mathrm{S}_{t_{2} / z^{2}} g_{\varepsilon^{\prime}}\right\rangle \mathrm{A}\left(\mathrm{~S}_{t_{2} / z^{2}} g_{1-\varepsilon^{\prime}}\right) \\
& \quad \quad+\mathrm{A}^{+}\left(\mathrm{S}_{t_{2} / z^{2}} g_{\varepsilon^{\prime}}\right) \mathrm{A}\left(\mathrm{~S}_{t_{2} / z^{2}} g_{1-\varepsilon^{\prime}}\right) \mathrm{A}\left(\mathrm{~S}_{t_{1} / z^{2}} g_{1-\varepsilon}\right) \tag{5.14}
\end{align*}
$$

and by (1.9) the scalar product is not equal to zero only when $\varepsilon^{\prime}=1-\varepsilon$. Thus (5.12) can be rewritten as

$$
\begin{align*}
z^{-1} \sum_{i=1}^{\mathrm{N}} & \sum_{\varepsilon \in\{0,1\}} \int_{0}^{t} d t_{1} \int_{\mathrm{S}_{i} / z^{2}}^{\mathrm{T}_{i} / z^{2}}\left\langle\mathrm{~S}_{t_{1} / z^{2}} g_{\varepsilon}, \mathrm{S}_{u} f_{i}\right\rangle d u .(-1)^{i} \\
& \left\langle\mathrm{D}_{1-\varepsilon}^{+} \mathrm{D}_{\varepsilon}^{+} u \otimes \Phi_{\mathrm{N}}\left(z \int_{\mathrm{S}_{k} / z^{2}}^{\mathrm{T}_{k} / z^{2}} \mathrm{~S}_{u} f_{k} d u, k \in\{1, \ldots, \mathrm{~N}\} \backslash\{i\}\right),\right. \\
& \left.1 \otimes \mathrm{~A}\left(\mathrm{~S}_{t_{1} / z^{2}} g_{1-\varepsilon}\right) \Phi_{\mathrm{N}^{\prime}}\left(z \int_{\mathrm{S}_{k}^{\prime} / z^{2}}^{\mathrm{T}_{k}^{\prime} / z^{2}} \mathrm{~S}_{u} f_{k}^{\prime} d u, k=1, \ldots, \mathrm{~N}^{\prime}\right)\right\rangle \\
& +z^{-1} \sum_{i=1}^{\mathrm{N}} \sum_{\varepsilon \in\{0,1\}} \int_{0}^{t} d t_{1} \int_{\mathrm{S}_{i} / z^{2}}^{\mathrm{T}_{i} / z^{2}}\left\langle\mathrm{~S}_{t_{1} / z^{2}} g_{\varepsilon}, \mathrm{S}_{u} f_{i}\right\rangle d u .(-1)^{i} \\
& \left\langle\mathrm{D}_{1-\varepsilon}^{+} \mathrm{D}_{\varepsilon}^{+} u \otimes \Phi_{\mathrm{N}}\left(z \int_{\mathrm{S}_{k} / z^{2}}^{\mathrm{T}_{k} / z^{2}} \mathrm{~S}_{u} f_{k} d u, k \in\{1, \ldots, \mathrm{~N}\} \backslash\{i\}\right),\right. \\
& \left(\frac{1}{z^{2}} \cdot \int_{0}^{t_{1}} d t_{2}\left\langle\mathrm{~S}_{t_{1} / z^{2}} g_{1-\varepsilon}, \mathrm{S}_{t_{2} / z^{2}} g_{1-\varepsilon}\right\rangle \mathrm{A}\left(\mathrm{~S}_{t_{2} / z^{2}} g_{1-\varepsilon^{\prime}}\right) \mathrm{U}_{t_{2} / z^{2}}\right. \\
& +\frac{1}{z^{2}} \cdot \int_{0}^{t_{1}} d t_{2} \mathrm{~A}^{+}\left(\mathrm{S}_{t_{2} / z^{2}}^{2} g_{\varepsilon^{\prime}}\right) \mathrm{A}^{2}\left(\mathrm{~S}_{t_{2} / z^{2}} g_{1-\varepsilon^{\prime}}\right) \mathrm{A}\left(\mathrm{~S}_{t_{1} / z^{2}} g_{1-\varepsilon}\right) \\
& \left.\int_{0}^{t_{2} / z^{2}} d t_{3} \ldots \int_{0}^{t_{n-1}} d t_{n}(-i)^{n-2} \mathrm{~V}\left(t_{3}\right) \ldots \mathrm{V}\left(t_{n}\right)\right)
\end{align*}
$$

Now let see the third term of (5.15) and try to move the annihilation operator $\mathrm{A}\left(\mathrm{S}_{t_{1} / z^{2}} g_{1-\varepsilon}\right)$ to the right hand side of product $\mathrm{V}\left(t_{3}\right) \ldots \mathrm{V}\left(t_{n}\right)$ so that we can let the annihilator act on the $\Phi_{\mathrm{N}^{\prime}}$-number vector. In order to do this, from the formulas (1.13) and (5.14) we know that the annihilator $\mathrm{A}\left(\mathrm{S}_{t_{1} / z^{2}} g_{1-\varepsilon}\right)$ can appear in two ways:

1. it is used to produce a scalar product with a creator $\mathrm{A}^{+}\left(\mathrm{S}_{t_{j}} g_{1-\varepsilon}\right)$

$$
\begin{equation*}
\left\langle\mathrm{S}_{t_{1} / z^{2}} g_{1-\varepsilon}, \mathrm{S}_{t_{j}} g_{1-\varepsilon}\right\rangle \tag{5.16}
\end{equation*}
$$

where $j=3,4, \ldots, n$;
2. the annihilation operator is simply exchanged with the product $\mathrm{V}\left(t_{3}\right) \ldots \mathrm{V}\left(t_{n}\right)$.

In the case 1 , since $j \geqq 3$, one obtains a term of type II , therefore its limit is zero: all the terms of this type are collected in $o(1)$ below. Thus
(5.16) is equal to

$$
\begin{align*}
& z^{-1} \sum_{i=1}^{\mathrm{N}} \sum_{\varepsilon \in\{0,1\}} \int_{0}^{t} d t_{1} \int_{\mathrm{S}_{i} / z^{2}}^{\mathrm{T}_{i} / z^{2}}\left\langle\mathrm{~S}_{t_{1} / z^{2}} g_{\varepsilon}, \mathrm{S}_{u} f_{i}\right\rangle d u .(-1)^{i} \\
& \left\langle\mathrm{D}_{1-\varepsilon}^{+} \mathrm{D}_{\varepsilon}^{+} u \otimes \Phi_{\mathrm{N}}\left(z \int_{\mathrm{S}_{k} / z^{2}}^{\mathrm{T}_{k} / z^{2}} \mathrm{~S}_{u} f_{k} d u, k \in\{1, \ldots, \mathrm{~N}\} \backslash\{i\}\right),\right. \\
& \left.1 \otimes \mathrm{~A}\left(\mathrm{~S}_{t_{1} / z^{2}} g_{1-\varepsilon}\right) \Phi_{\mathrm{N}^{\prime}}\left(z \int_{\mathrm{S}_{k}^{\prime} / z^{2}}^{\mathrm{T}_{k^{\prime} / z^{2}}} \mathrm{~S}_{u} f_{k}^{\prime} d u, k=1, \ldots, \mathrm{~N}^{\prime}\right)\right\rangle \\
& \quad+z^{-1} \sum_{i=1}^{\mathrm{N}} \sum_{\varepsilon \in\{0,1\}} \int_{0}^{t} d t_{1} \int_{\mathrm{S}_{i} / z^{2}}^{\mathrm{T}_{i} / z^{2}}\left\langle\mathrm{~S}_{t_{1} / z^{2}} g_{\varepsilon}, \mathrm{S}_{u} f_{i}\right\rangle d u .(-1)^{i} \\
& \left\langle\mathrm{D}_{1-\varepsilon}^{+} \mathrm{D}_{\varepsilon}^{+} u \otimes \Phi_{\mathrm{N}}\left(z \int_{\mathrm{S}_{k} / z^{2}}^{\mathrm{T}_{k} / z^{2}} \mathrm{~S}_{u} f_{k} d u, k \in\{1, \ldots, \mathrm{~N}\} \backslash\{i\}\right),\right. \\
& \left(\frac{1}{z^{2}} \cdot \int_{0}^{t_{1}} d t_{2}\left\langle\mathrm{~S}_{t_{1} / z^{2}} g_{1-\varepsilon}, \mathrm{S}_{t_{2} / z^{2}} g_{1-\varepsilon}\right\rangle \mathrm{A}\left(\mathrm{~S}_{t_{2} / z^{2}} g_{1-\varepsilon^{\prime}}\right) \mathrm{U}_{t_{1} / z^{2}}\right. \\
& \\
& \quad+\frac{1}{z^{2}} \cdot \int_{0}^{t_{1}} d t_{2} \mathrm{~A}^{+}\left(\mathrm{S}_{t_{2} / z^{2}} g_{\varepsilon^{\prime}}\right) \mathrm{A}\left(\mathrm{~S}_{t_{2} / z^{2}} g_{1-\varepsilon^{\prime}}\right) \\
&  \tag{5.17}\\
& \left.\int_{0}^{t_{2} / z^{2}} d t_{3} \ldots \int_{0}^{t_{n-1}} d t_{n}(-i)^{n-2} \mathrm{~V}\left(t_{3}\right) \ldots \mathrm{V}\left(t_{n}\right) \mathrm{A}\left(\mathrm{~S}_{t_{1} / z^{2}} g_{1-\varepsilon}\right)\right) \\
& \Phi_{\mathrm{N}}\left(z \int_{\mathrm{S}_{k}^{\prime} / z^{2}}^{\mathrm{t}_{k}^{\prime} / z^{2}} \mathrm{~S}_{u} f_{k}^{\prime} d u, k=1, \ldots, \mathrm{~N}^{\prime}\right)>+o(1),
\end{align*}
$$

By letting the annihilator $\mathrm{A}\left(\mathrm{S}_{t_{1} / z^{2}} g_{1-\varepsilon}\right)$ act on the number vector $\Phi_{\mathrm{N}^{\prime}}\left(z \int_{\mathrm{S}_{k}^{\prime} / z^{2}}^{\mathbf{T}_{k}^{\prime} z^{2}} \mathrm{~S}_{u} f_{k}^{\prime} d u, k=1, \ldots, \mathrm{~N}^{\prime}\right)$ one obtains

$$
\begin{align*}
\sum_{j=1}^{\mathrm{N}^{\prime}} z(-1)^{j} \int_{\mathrm{S}_{j}^{\prime} / z^{2}}^{\mathrm{T}_{j}^{\prime} / z^{2}} & \left\langle\mathrm{~S}_{t_{1} / z^{2}} g_{1-\varepsilon}, \mathrm{S}_{u} f_{j}^{\prime}\right\rangle \\
& \times d u \Phi_{\mathrm{N}^{\prime}-1}\left(z \int_{\mathrm{S}_{k}^{\prime} / z^{2}}^{\mathrm{T}_{k}^{\prime} / z^{2}} \mathrm{~S}_{u} f_{k}^{\prime} d u, k \in\left\{1, \ldots, \mathrm{~N}^{\prime}\right\} \backslash\{j\}\right) \tag{5.18}
\end{align*}
$$

Finally recall that as $z \rightarrow 0$ one has

$$
\left.\begin{array}{c}
\int_{\mathrm{S}_{i} / z^{2}}^{\mathrm{T}_{i} / z^{2}}\left\langle\mathrm{~S}_{i 1 / z^{2}} g_{\sigma}, \mathrm{S}_{u} f_{i}\right\rangle d u \rightarrow \chi_{\left[\mathrm{S}_{i}, \mathbf{T}_{i}\right]}\left(t_{1}\right)\left(g_{\sigma} \mid f_{i}\right) ;  \tag{5.19a}\\
\sigma=\varepsilon, 1-\varepsilon
\end{array}\right\}
$$

and

$$
\begin{gather*}
z^{-2} \int_{0}^{t_{n-1}} d t_{n}\left\langle\mathrm{~S}_{t_{n-1} / z^{2}} g_{\sigma}, \mathrm{S}_{t_{n} / z^{2}} g_{\sigma}\right\rangle \rightarrow\left(g_{\sigma} \mid g_{\sigma}\right)_{-} ;  \tag{5.19b}\\
\sigma=\varepsilon, \quad 1-\varepsilon, n \in \mathbf{N}
\end{gather*}
$$

From the above, in the notations (5.1), (5.2), we deduce:

$$
\begin{align*}
& \left\langle u, \mathrm{~F}_{z}\left(t ; \mathrm{N}, \mathrm{~N}^{\prime} ;\binom{f_{1}, \ldots, f_{\mathrm{N}}}{f_{1}^{\prime}, \ldots, f_{\mathrm{N}^{\prime}}^{\prime}}\right)\right\rangle \\
& =\left\langle u \otimes \Psi_{\mathrm{N}}\left(\chi_{\left[\mathrm{S}_{\alpha}, \mathrm{T}_{\alpha}\right]} \otimes f_{\alpha}, \alpha \in\{1, \ldots, \mathrm{~N}\}\right),\right. \\
& v \otimes \Psi_{\mathrm{N}^{\prime}}\left(\chi_{\left[s_{\alpha}^{\prime}, r_{\alpha}^{\prime}\right]} \otimes f_{\alpha}^{\prime}, \alpha \in\left\{1, \ldots, \mathrm{~N}^{\prime}\right\}\right\rangle \\
& \begin{aligned}
+\sum_{i=1}^{\mathrm{N}} & \sum_{j=1}^{\mathrm{N}^{\prime}} \sum_{\varepsilon \in\{0,1\}} \int_{0}^{t} d t_{1} \chi_{\left[\mathrm{S}_{i}, \mathrm{~T}_{i}\right]}\left(t_{1}\right)\left(f_{i} \mid g_{\varepsilon}\right) \\
& \times \chi_{\left[\mathrm{Sj}_{j}^{\prime}, \mathrm{T}_{j}^{\prime}\right]}\left(t_{1}\right)\left(g_{1-\varepsilon} \mid f_{j}^{\prime}\right)(-1)^{i+j}
\end{aligned} \\
& \left\langle\mathrm{D}_{\varepsilon}^{+} u, \mathrm{~F}\left(s ; \mathrm{N}-1, \mathrm{~N}^{\prime}-1 ;\binom{f_{1}, \ldots, \hat{f}_{i}, \ldots, f_{\mathrm{N}}}{f_{1}^{\prime}, \ldots, \hat{f}_{j}^{\prime}, \ldots, f_{\mathrm{N}^{\prime}}^{\prime}}\right)\right\rangle \\
& +z^{-1} \sum_{i=1}^{\mathrm{N}} \sum_{\varepsilon \in\{0,1\}} \int_{0}^{t} d t_{1} \int_{\mathrm{S}_{i} / z^{2}}^{\mathrm{T}_{i} / z^{2}}\left\langle\mathrm{~S}_{\mathrm{t}_{1} / z^{2}} g_{\varepsilon}, \mathrm{S}_{u} f_{i}\right\rangle d u .(-1)^{i} \\
& \left\langle\mathrm{D}_{1-\varepsilon}^{+} \mathrm{D}_{\varepsilon}^{+} u \otimes \Phi_{\mathrm{N}}\left(z \int_{\mathrm{S}_{k} / z^{2}}^{\mathrm{T}_{k} / z^{2}} \mathrm{~S}_{u} f_{k} d u, k \in\{1, \ldots, \mathrm{~N}\} \backslash\{i\}\right)\right. \text {, } \\
& \frac{1}{z^{2}} \cdot \int_{0}^{t_{1}} d t^{2}\left\langle\mathrm{~S}_{t_{1} / z^{2}} g_{1-\varepsilon}, \mathrm{S}_{t_{2} / z^{2}} g_{1-\varepsilon}\right\rangle \mathrm{A}\left(\mathrm{~S}_{\mathrm{t}_{2} / z^{2}} g_{1-\varepsilon^{\prime}}\right) \mathrm{U}_{t_{2} / z^{2}} \\
& \left.+\Phi_{\mathrm{N}^{\prime}}\left(z \int_{\mathrm{S}_{k}^{\prime} / z^{2}}^{\mathrm{T}_{k}^{\prime} z^{2}} \mathrm{~S}_{u} f_{k}^{\prime} d u, k=1, \ldots, \mathrm{~N}^{\prime}\right)\right\rangle+o(1) \tag{5.20}
\end{align*}
$$

Notice that in (5.20) the last term is similar to (5.12), therefore by repeating the discussion from (5.12) to (5.20), we have

$$
\begin{aligned}
& \left\langle u, \mathrm{~F}_{z}\left(t ; \mathrm{N}, \mathrm{~N}^{\prime} ;\binom{f_{1}, \ldots, f_{\mathrm{N}}}{f_{1}^{\prime}, \ldots, f_{\mathrm{N}^{\prime}}^{\prime}}\right)\right\rangle \\
& =\left\langle u \otimes \Psi_{\mathrm{N}}\left(\chi_{\left[\mathrm{S}_{\alpha}, \mathrm{T}_{\alpha}\right]} \otimes f_{\alpha}, \alpha \in\{1, \ldots, \mathrm{~N}\}\right),\right. \\
& v \otimes \Psi_{\mathrm{N}^{\prime}}\left(\chi_{\left[\mathrm{S}_{\alpha}^{\prime}, \mathrm{T}_{a}^{\prime}\right]} \otimes f_{\alpha}^{\prime}, \alpha \in\left\{1, \ldots, \mathrm{~N}^{\prime}\right\}\right\rangle \\
& \quad+\sum_{i=1}^{\mathrm{N}} \sum_{j=1}^{\mathrm{N}^{\prime}} \sum_{\varepsilon \in\{0,1\}} \int_{0} d t_{1} \chi_{\left[\mathrm{S}_{i}, \mathrm{~T}_{i}\right]}\left(t_{1}\right)\left(f_{i} \mid g_{\varepsilon}\right) \\
& \quad \times \chi_{\left[\mathrm{S}_{j}^{\prime}, \mathrm{T}_{j}^{\prime}\right]}\left(t_{1}\right)\left(g_{1-\varepsilon} \mid f_{j}^{\prime}\right) .(-1)^{i+j}
\end{aligned}
$$

$$
\begin{gather*}
+\sum_{i=1}^{\mathrm{N}} \sum_{j=1}^{\mathrm{N}^{\prime}} \sum_{\varepsilon \in\{0,1\}} \int_{0}^{t} d t_{1} \chi_{\left[\mathrm{S}_{i}, \mathrm{~T}_{\mathrm{i}}\right]}\left(t_{1}\right)\left(f_{i} \mid g_{\varepsilon}\right) \\
\times\left(g_{1-\varepsilon} \mid g_{1-\varepsilon}\right)_{-} \cdot \chi_{\left[\mathrm{S}_{j}, \mathrm{~T}_{j]}\right]}\left(t_{1}\right)\left(g_{\varepsilon} \mid f_{j}^{\prime}\right) .(-1)^{i+j} \\
\left\langle\mathrm{D}_{1-\varepsilon}^{+} \mathrm{D}_{\varepsilon}^{+}\right. \\
\left.u \mathrm{~F}\left(t_{1} ; \mathrm{N}-1, \mathrm{~N}^{\prime}-1:\binom{f_{1}, \ldots, \hat{f}_{i}, \ldots, f_{\mathrm{N}}}{f_{1}^{\prime}, \ldots, \hat{f}_{j}^{\prime}, \ldots, f_{\mathrm{N}^{\prime}}^{\prime}}\right)\right\rangle \\
+z^{-1} \sum_{i=1}^{\mathrm{N}} \sum_{\varepsilon \in\{0,1\}} \int_{0}^{t} d t_{1} \chi_{\left[\mathrm{S}_{i}, \mathrm{~T}_{i}\right]}\left(t_{1}\right)\left(f_{i} \mid g_{\varepsilon}\right) \\
\times z^{-2} \int_{0}^{t_{1}} d t_{2}\left\langle\mathrm{~S}_{t_{1} / z^{2}} g_{1-\varepsilon}, \mathrm{S}_{t_{2} / z^{2}} g_{1-\varepsilon}\right\rangle \\
\times z^{-2} \int_{0}^{t_{2}} d t_{3}\left\langle\mathrm{~S}_{t_{2} / z^{2}} g_{\varepsilon}, \mathrm{S}_{t_{3} / z^{2}} g_{\varepsilon}\right\rangle \\
\left\langle\mathrm{D}_{\varepsilon}^{+} \mathrm{D}_{1-\varepsilon}^{+} \mathrm{D}_{\varepsilon}^{+} u \otimes \Phi_{\mathrm{N}}\left(z \int_{\mathrm{S}_{k} / z^{2}}^{\mathrm{T}_{k} / z^{2}} \mathrm{~S}_{u} f_{k} d u, k \in\{1, \ldots, \mathrm{~N}\} \backslash\{i\}\right),\right. \\
1 \otimes \mathrm{~A}\left(\mathrm{~S}_{t_{3} / z^{2}} g_{\varepsilon}\right) \mathrm{U}_{t_{3} / z^{2}} \Phi_{\mathrm{N}^{\prime}}  \tag{5.21}\\
\\
\left.\times\left(z \int_{\mathrm{S}_{k}^{\prime} / z^{2}}^{\mathrm{T}^{\prime} / z^{2}} \mathrm{~S}_{u} f_{k}^{\prime} d u, k=1, \ldots, \mathrm{~N}^{\prime}\right)\right\rangle+o(1)
\end{gather*}
$$

Iterating $n$ times the above procedure one finds that the scalar product

$$
\left\langle u, \mathrm{~F}_{z}\left(t ; \mathrm{N}, \mathrm{~N}^{\prime} ;\binom{f_{1}, \ldots, f_{\mathrm{N}}}{f_{1}^{\prime}, \ldots, f_{\mathrm{N}^{\prime}}^{\prime}}\right)\right\rangle
$$

is expressed as a sum of several terms. Denoting by $\mathrm{T}_{k}$ the sum of all the terms obtained in the $k$-th step with the exception of the first and the last summands, one has

$$
\begin{align*}
& \mathrm{T}_{n}=\mathrm{T}_{n+1}+\sum_{i=1}^{\mathrm{N}} \sum_{j=1}^{\mathrm{N}^{\prime}} \sum_{\varepsilon \in\{0,1\}} \int_{0}^{t} d t_{1} \chi_{\left[\mathrm{S}_{i}, \mathrm{~T}_{i}\right]}\left(t_{1}\right)\left(f_{i} \mid g_{\varepsilon}\right) \\
& \times\left(g_{1-\varepsilon} \mid g_{1-\varepsilon}\right)-\left(g_{\varepsilon} \mid g_{\varepsilon}\right)-\ldots\left(g_{\varepsilon_{n}} \mid g_{1-\varepsilon_{n}}\right) \\
& -\cdot \chi_{\left[\mathrm{S}_{j}, \mathrm{~T}_{j}\right]}\left(t_{1}\right)\left(g_{\varepsilon_{n}} \mid f_{j}^{\prime}\right) \cdot(-1)^{i+j} \\
& \left\langle\mathrm { D } _ { 1 - \varepsilon _ { n } } ^ { + } \ldots \mathrm { D } _ { 1 - \varepsilon } ^ { + } \mathrm { D } _ { \varepsilon } ^ { + } u \mathrm { F } \left( t_{1} ; \mathrm{N}-1, \mathrm{~N}^{\prime}-1 ;\right.\right. \\
& \left.\left.\binom{f_{1}, \ldots, \hat{f}_{i}, \ldots, f_{\mathrm{N}}}{f_{1}^{\prime}, \ldots, \hat{f}_{j}^{\prime}, \ldots, f_{\mathrm{N}^{\prime}}^{\prime}}\right)\right\rangle \tag{5.22}
\end{align*}
$$

where

$$
\varepsilon_{n}:= \begin{cases}1-\varepsilon & \text { if } n \text { is odd }  \tag{5.23}\\ \varepsilon, & \text { if } n \text { is even }\end{cases}
$$

Moreover the last summand in the $n$-th step is

$$
\begin{gather*}
z^{-1} \sum_{i=1}^{\mathrm{N}} \sum_{\varepsilon \in\{0,1\}} \int_{0}^{t} d t_{1} \chi_{\left[\mathrm{S}_{i}, \mathrm{~T}_{i}\right]}\left(t_{1}\right)\left(f_{i} \mid g_{\varepsilon}\right) \\
\quad \times z^{-2} \int_{0}^{t_{1}} d t_{2}\left\langle\mathrm{~S}_{t_{1} / z^{2}} g_{1-\varepsilon}, \mathrm{S}_{t_{2} / z^{2}} g_{1-\varepsilon}\right\rangle \\
\quad \times z^{-2} \int_{0}^{t_{2}} d t_{3}\left\langle\mathrm{~S}_{t_{2} / z^{2}} g_{\varepsilon}, \mathrm{S}_{\mathrm{t}_{3} / z^{2}} g_{\varepsilon}\right\rangle \\
\times \ldots \times z^{-2} \int_{0}^{t_{n-1}} d t_{n}\left\langle\mathrm{~S}_{t_{n-1} / z^{2}} g_{\varepsilon_{n}}, \mathrm{~S}_{t_{n} / z^{2}} g_{\varepsilon_{n}}\right\rangle \\
\quad \ldots\left\langle\mathrm{D}_{1-\varepsilon_{n}}^{+} \ldots \mathrm{D}_{\varepsilon}^{+} \mathrm{D}_{1-\varepsilon}^{+} \mathrm{D}_{\varepsilon}^{+} u\right. \\
\times \Phi_{\mathrm{N}}\left(z \int_{\mathrm{S}_{k} / z^{2}}^{\mathrm{T}_{k} / z^{2}} \mathrm{~S}_{u} f_{k} d u, k \in\{1, \ldots, \mathrm{~N}\} \backslash\{i\}\right) \\
1 \otimes \mathrm{~A}\left(\mathrm{~S}_{t_{n} / z^{2}} g_{\varepsilon_{n}}\right) \mathrm{U}_{t_{n} / z^{2}} \Phi_{\mathrm{N}}  \tag{5.24}\\
\\
\\
\left.\left(z \int_{\mathrm{S}_{k}^{\prime} / z^{2}}^{\mathrm{T}_{k}^{\prime} / z^{2}} \mathrm{~S}_{u} f_{k}^{\prime} d u, k=1, \ldots, \mathrm{~N}^{\prime}\right)\right\rangle+o(1)
\end{gather*}
$$

Notice that the term (5.24) differs from the corresponding one in the $(n-1)$-st step in that the operator $\mathrm{A}\left(\mathrm{S}_{t_{n-1} / z^{2}} g_{\varepsilon_{n-1}}\right)$ has been replaced by

$$
z^{-2} \int_{0}^{t_{n-1}} d t_{n}\left\langle\mathrm{~S}_{t_{n-1} / z^{2}} g_{\varepsilon_{n}}, \mathrm{~S}_{t_{n} / z^{2}} g_{\varepsilon_{n}}\right\rangle . \mathrm{A}\left(\mathrm{~S}_{t_{n} / z^{2}} g_{\varepsilon_{n}}\right)
$$

and the operator

$$
\mathrm{D}_{1-\varepsilon_{n-1}}^{+} \ldots \mathrm{D}_{\varepsilon}^{+} \mathrm{D}_{1-\varepsilon}^{+} \mathrm{D}_{\varepsilon}^{+}
$$

has been replaced by

$$
\mathrm{D}_{1-\varepsilon_{n}}^{+} \ldots \mathrm{D}_{\varepsilon}^{+} \mathrm{D}_{1-\varepsilon}^{+} \mathrm{D}_{\varepsilon}^{+} .
$$

Therefore it follows, from the induction argument and formula (5.19b) that

$$
\begin{align*}
& \left\langle u, \mathrm{~F}_{z}\left(t ; \mathrm{N}, \mathrm{~N}^{\prime} ;\binom{f_{1}, \ldots, f_{\mathrm{N}}}{f_{1}^{\prime}, \ldots, f_{\mathrm{N}^{\prime}}^{\prime}}\right)\right\rangle \\
& =\left\langle u \otimes \Psi_{\mathrm{N}}\left(\chi_{\left[\mathrm{S}_{\alpha}, \mathrm{T}_{\alpha]}\right]} \otimes f_{\alpha}, \alpha \in\{1, \ldots, \mathrm{~N}\}\right),\right. \\
& v \otimes \Psi_{\mathrm{N}^{\prime}}\left(\chi_{\left[\mathrm{S}_{\alpha}^{\prime}, \mathrm{T}_{\alpha}^{\prime}\right]} \otimes f_{\alpha}^{\prime}, \alpha \in\left\{1, \ldots, \mathrm{~N}^{\prime}\right\}\right\rangle \\
& +\sum_{n=1}^{\infty} \sum_{i=1}^{\mathrm{N}} \sum_{j=1}^{\mathrm{N}^{\prime}} \sum_{\varepsilon \in\{0,1\}} \int_{0}^{t} d t_{1} \chi_{\left[\mathrm{S}_{i}, \mathrm{~T}_{i}\right]}\left(t_{1}\right)\left(f_{i} \mid g_{\varepsilon}\right) \\
& \times\left(g_{1-\varepsilon} \mid g_{1-\varepsilon}\right)-\left(g_{\varepsilon} \mid g_{\varepsilon}\right)-\left(g_{1-\varepsilon} \mid g_{1-\varepsilon}\right)-. \chi_{\left[\mathrm{S}_{j}, \mathrm{~T}_{j}\right]}\left(t_{1}\right)\left(g_{\varepsilon} \mid f_{j}^{\prime}\right) .(-1)^{i+j} \\
& \left\langle\mathrm { D } _ { 1 - \varepsilon } ^ { + } \mathrm { D } _ { \varepsilon } ^ { + } \mathrm { D } _ { 1 - \varepsilon } ^ { + } \mathrm { D } _ { \varepsilon } ^ { + } u \mathrm { F } \left( t_{1} ; \mathrm{N}-1, \mathrm{~N}^{\prime}-1 ;\right.\right. \\
&  \tag{5.25}\\
& \left.\left.\quad\binom{f_{1}, \ldots, \hat{f}_{i}, \ldots, f_{\mathrm{N}}}{f_{1}^{\prime}, \ldots, f_{j}^{\prime}, \ldots, f_{\mathrm{N}^{\prime}}^{\prime}}\right)\right\rangle+o(1)
\end{align*}
$$

Finally by rewriting the right hand side of (5.25) as the sum of two terms corresponding to $n$ odd or even and letting $z$ tend to zero, we obtain (5.5a). It is easy to check ( $5.5 b$ ) and (5.5c).

Now let us introduce some notations on the Fock space $\Gamma\left(\mathrm{L}^{2}\left(\mathbf{R} \otimes(\mathrm{~K},(. \mid)\right.\right.$.$) . For each \xi \in \mathrm{B}\left(\mathrm{L}^{2}(\mathbf{R})\right), \mathrm{T} \in \mathrm{B}(\mathrm{K})$, denote $\mathrm{N}(\xi \otimes \mathrm{T})$ the number operator, characterized by the property

$$
\begin{align*}
\left\langle\Psi _ { \mathrm { N } } \left(\eta_{r} \otimes f_{r}, r=\right.\right. & \left.\left.1, \ldots, \mathrm{~N}^{\mathrm{N}}\right), \mathrm{~N}(\xi \otimes \mathrm{~T}) \Psi_{\mathrm{N}^{\prime}}\left(\eta_{r}^{\prime} \otimes f_{r}^{\prime}, r=1, \ldots, \mathrm{~N}^{\prime}\right)\right\rangle \\
= & \sum_{j=1} \sum_{k=1}(-1)^{j+k}\left\langle\eta_{j}, \xi \eta_{k}^{\prime}\right\rangle .\left\langle f_{j}, \mathrm{~T} f_{k}^{\prime}\right\rangle \\
& \left\langle\Psi_{\mathrm{N}-1}\left(\eta_{r} \otimes f_{r}, r \in\{1, \ldots, \mathrm{~N}\} \backslash\{j\}\right),\right. \\
& \left.\mathrm{N}(\xi \otimes \mathrm{~T}) \Psi_{\mathrm{N}^{\prime}-1}\left(\eta_{r}^{\prime} \otimes f_{r}^{\prime}, r \in\left\{1, \ldots, \mathrm{~N}^{\prime}\right\} \backslash\{k\}\right)\right\rangle \tag{5.26}
\end{align*}
$$

For each $f, g \in \mathrm{~K}, s \geqq 0$, define the number process $\mathrm{N}_{s}(f, g)$ by $\mathrm{N}\left(\chi_{[0, s]} \otimes|f><g|\right)$. Consider the quantum stochastic differential equation

$$
\begin{align*}
& \mathrm{U}(t)=1+\int_{0}^{t} \sum_{\sigma \in\{0,1\}}\left(\mathrm{D}_{1}(\sigma) \otimes d \mathrm{~N}_{s}(\sigma, 1-\sigma)\right. \\
&\left.+\mathrm{D}_{2}(\sigma) \otimes d \mathrm{~N}_{s}(\sigma, \sigma)\right) \mathrm{U}(s) \tag{5.27}
\end{align*}
$$

where,

$$
\begin{equation*}
\mathrm{N}_{s}(\sigma, \varepsilon):=\mathrm{N}_{s}\left(g_{\sigma}, g_{\varepsilon}\right) \tag{5.28}
\end{equation*}
$$

Theorem (5.3). - The quantum stochastic differential equation (5.27) has a unique and unitary solution.

Proof. - The existence and uniqueness of the solution of q.s.d.e. (5.27) follows form the fact that $\mathrm{D}_{1}(\sigma), \mathrm{D}_{2}(\sigma)$ are bounded operators. The proof of unitarity is the same as the one of Theorem (6.3) of [1].

Now our last assertion can be stated and proved as following:
Theorem (5.4). - Under the conditions (1.8), (1.9) and (4.5), the limit (1.19) is of form

$$
\begin{align*}
\left\langleu \otimes \Psi _ { \mathrm { N } } \left(\chi_{\left[\mathrm{S}_{r}, \mathrm{~T}_{r}\right]} \otimes f_{r} r=1\right.\right. & \ldots, \mathrm{N}), \\
& \mathrm{U}(t) v \otimes \Psi_{\mathrm{N}^{\prime}}\left(\chi_{\left[\mathrm{S}_{r}^{\prime}, \mathrm{T}_{r}^{\prime}\right]} \otimes f_{r}^{\prime}, r=1, \ldots, \mathrm{~N}^{\prime}\right) \tag{5.29}
\end{align*}
$$

and where $\mathrm{U}(t)$ is the solution of the quantum stochastic differential equation (5.27).

Proof. - Clearly (5.29) can be written in the form:

$$
\begin{equation*}
\left\langle u, \mathrm{G}\left(t ; \mathrm{N}, \mathrm{~N}^{\prime} ;\binom{f_{1}, \ldots, f_{\mathrm{N}}}{f_{1}^{\prime}, \ldots, f_{\mathrm{N}^{\prime}}^{\prime}}\right)\right\rangle \tag{5.30}
\end{equation*}
$$

Using the QSDE (5.27) it is easy to show that (5.30) satisfies the system of differential equations ( $5.5 a, b, c$ ).

Since $D_{1}(\sigma), D_{2}(\sigma)$ are the bounded operators, one knows that the differential equation has a unique solution. This allows to identify (5.29) with (5.2) and therefore, by Theorem (5.1), with the limit (1.19). This completes the proof.
