# A Theorem on Direct Products of Slender Modules. 

John D. O’Neill (*)

## 1. Introduction.

Let $R$ be a ring. A class $\mathcal{C}$ of $R$-modules is called transitive if, for each, $\quad X, Y, Z$ in $\mathcal{C}, \operatorname{Hom}_{R}(X, Y) \neq 0 \neq \operatorname{Hom}_{R}(Y, Z) \quad$ implies $\operatorname{Hom}_{R}(X, Z) \neq 0$. If $\operatorname{Hom}_{R}(X, Y) \neq 0 \neq \operatorname{Hom}_{R}(Y, X)$, then $X$ and $Y$ have the same type. Our main result is the following.

Theorem 1. Let $\mathcal{C}$ be a transitive class of slender $R$-modules. If $\prod_{I} G_{i}=A \oplus B$ with $G_{i}$ in $\mathcal{C}$ and $I$ countable, then $A$ is isomorphic to a direct product of members of $\mathcal{C}$ if this result is true whenever all $G_{i}$ 's have the same type.

In section 4, using a result from [4], we generalize Theorem 1 to the case where $I$ is any set of non-measurable cardinality.

In section 5 we present some applications of the theorem. In particular Corollary 8 includes the case where $R$ is the ring of integers and $\mathcal{C}$ is the class of rank one torsion-free reduced abelian groups. This case is Theorem 4.3 in [4]. The proof there was defective (Lemma 4.2 was false). Thus our proof here of Theorem 1 (hence of Corollary 8) supplants the proof of Theorem 4.3 in [4].

## 2. Preliminaries.

All rings are associative with unity and all modules (except in Cor. 9) are left unital. Let $C$ be a transitive class of $R$-modules.
(*) Indirizzo dell'A.: University of Detroit, Detroit, MI. 48221, T.S.A.
«Having the same type» is an equivalence relation on the members of $\mathcal{C}$. If type $X=t$, type $Y=s$, and $\operatorname{Hom}_{R}(X, Y) \neq 0$, we write $t \leqslant s$. This relation is a partial order on the types of members of $\mathcal{C}$. By $t<s$ we mean $t \leqslant s$ and $s \leqslant t$. An $R$-module has finite rank if it is isomorphic to a submodule of a finite direct sum of members of $\mathcal{C}$. A submodule $X$ is fully invariant in $Y$ if: for any homomorphism $f: Y \rightarrow Y, f(X) \subseteq X$. In this case a decomposition of $Y$ induces a decomposition of $X$.

The first infinite ordinal (a cardinal) is $\omega$ and it is identified with the set of finite ordinals. Let $R^{\omega}$ be the direct product of $\omega$ copies of $R$. An $R$-module $X$ is slender if each $R$-homomorphism $R^{\omega} \rightarrow X$ sends all but a finite number of components of $R^{\omega}$ to 0 .

We shall presume a basic knowledge of slender modules and direct products of modules such as is found in [1, 2 and 4] and in the papers referenced there. Lemmas 3.1 and 3.2 in [4] are basic and, being wellknown, are often used without mention.

Observe that the class $\mathcal{C}$ in Theorem 1 satisfies the following Clause: If $\prod_{I} G_{i}=A \oplus B$ where $|I| \leqslant \omega$ and all $G_{i}$ 's have the same type, then $A$ is isomorphic to a direct product of members of $\mathcal{C}$. It will be clear after Lemma 2 that the components of $A$ have the same type as the $G_{2}$ 's.

## 3. Proof of Theorem 1.

Write $\quad V=\prod_{I} G_{i}=A \oplus B$ as in Theorem 1. Let $\alpha: V \rightarrow A$, $\beta: V \rightarrow B$ and $\alpha_{i}: V \rightarrow A \rightarrow G_{i}$ be the obvious projections. Let each $G_{i}$ have type $t_{i}$. For a fixed type $s$ write $V_{s}=\prod_{t_{i}=s} G_{i}$ and $V^{s}=\prod_{t_{i}>s} G_{i}$. If $J \subseteq I$, then $V_{J}=\prod_{i \in J} G_{i}$. We will adhere strictly to this notation.

Lempa 2. For each type $s$
(1) $V_{s} \oplus V^{s}$ and $V^{s}$ are fully invariant in $V$,
(2) $\alpha\left(V_{s} \oplus V^{s}\right)=A \cap\left(V_{s} \oplus \beta\left(V^{s}\right)\right) \oplus \alpha\left(V^{s}\right)$,
(3) We may assume the decomposition $V=\prod_{I} G_{i}$ is such that $V_{s}=\prod_{\boldsymbol{X}_{s}} G_{i} \oplus \prod_{\boldsymbol{r}_{s}} G_{i}$ for subsets $X_{s}, \boldsymbol{Y}_{s}$ of $I$ so that $\alpha$ induces an isomorphism between $V_{X_{s}}$ and $\alpha\left(V_{X_{s}}\right)=A \cap\left(V_{s} \oplus \beta\left(V^{s}\right)\right)$, which is thus a direct product of members of $\mathcal{C}$ of type $s$.

Proof. (1) is clear and (2) follows (1) by standard arguments. From (1) the members of any new $\mathcal{C}$-decomposition of $V_{s}$ have type $s$. Also $\beta\left(V_{s} \oplus V^{s}\right)=\boldsymbol{B} \cap\left(V_{s} \oplus \alpha\left(V^{s}\right)\right) \oplus \beta\left(V^{s}\right)$ and $V_{s} \oplus V^{s}=\left[A \cap\left(V_{s} \oplus\right.\right.$ $\left.\left.\oplus \beta\left(V^{s}\right)\right) \oplus B \cap\left(V_{s} \oplus \alpha\left(V^{s}\right)\right)\right] \oplus V^{s}$. Now $V_{s}$ is isomorphic to the summand in the bracket and, by the Clause, each summand in the bracket is isomorphic to a direct product of members of $\mathcal{C}$ of type $s$. It we project each of these summands to $V_{s}$ we get the desired decomposition of $V_{s}$.

Lemma 3. Let $T$ be a finite set of types and let $s$ be a minimal type in $T$. Assume Lemma 2. Set $V^{T}=\prod_{J} G_{i}$ where $J=\left\{i: t_{i}>\right.$ some $t$ in $T$ or $\left.t_{i} \in T \backslash\{s\}\right\}$ and set ${ }_{T} V=\prod_{\boldsymbol{K}} G_{i}$ where $K=\left\{i: t_{i} \neq\right.$ any $t$ in $\left.T\right\}$; so $V={ }_{T} V \oplus V_{s} \oplus V^{T}$. Then
(1) $V_{s} \oplus V^{T}$ and $V^{T}$ are fully invariant in $V$,
(2) $A=A \cap\left({ }_{T} V \oplus \beta\left(V_{s} \oplus V^{T}\right)\right) \oplus \alpha\left(V_{X_{s}}\right) \oplus \alpha\left(V^{T}\right)$ for $X_{s}$ as in Lemma 2.

Proof. (1) is clear. Hence $A=A \cap\left({ }_{T} V \oplus \beta\left(V_{s} \oplus V^{T}\right)\right) \oplus A \cap$ $\cap\left(V_{s} \oplus \beta\left(V^{T}\right)\right) \oplus \alpha\left(V^{T}\right)$. Now $\quad A \cap\left(V_{s} \oplus \beta\left(V^{s}\right)\right) \subseteq A \cap\left(V_{s} \oplus \beta\left(V^{T}\right)\right)$ which, being in $\alpha\left(V_{s}\right)$, is in $A \cap\left(V_{s} \oplus \beta\left(V^{s}\right)\right)$. By Lemma $2 \alpha\left(V_{x_{s}}\right)=$ $=A \cap\left(V_{s} \oplus \beta\left(V^{T}\right)\right)$. Substitution yields (2).

Lemma 4. If $C$ is a finite rank direct summand of $V$, then $C$ is isomorphic to a finite direct sum of members of $\mathfrak{C}$.

Proof. By slenderness $C$ is a direct summand of a finite direct sum of $G_{i}$ 's. If all $G_{i}$ 's have the same type, the Clause applies. For the general case we may use Baer's classical proof for a direct summand of a finite direct sum of rank one torsionfree abelian groups (see Theorem 86.7 in [1]).

Lemma 5. Suppose $m \in I$. Then $A=\boldsymbol{E} \oplus \boldsymbol{F}$ where $\boldsymbol{E}$ has finite rank and $\alpha_{m}(F)=0$.

Proof. Since $G_{m}$ is slender, $\alpha_{m}\left(V_{t}\right)=0$ for all types $t$ except those in a finite set $T$. We induct on the order of $T$. If $T=\emptyset, \alpha_{m}(A) \subseteq$ $\subseteq \alpha_{m}(V)=0$; so $E=0$ and $F=A$ satisfy the Lemma. Otherwise let $s$ be a minimal type in $T$. From Lemma 3 we write $A=A \cap\left({ }_{T} V \oplus\right.$ $\left.\oplus \beta\left(V_{s} \oplus V^{T}\right)\right) \oplus \alpha\left(V_{X_{s}}\right) \oplus \alpha\left(V^{T}\right)$. Note that the left summand is in $\alpha\left({ }_{T} V\right)$ and $\alpha_{m}\left({ }_{T} V\right)=0$. Since $\alpha\left(V_{x_{s}}\right)$ is a product of $G_{i}$ 's of type $s$,
by slenderness $\alpha\left(V_{X_{s}}\right)=D \oplus E_{1}$ where $\alpha_{m}(D)=0$ and $E_{1}$ is a finite direct sum of $G_{i}$ 's of type $s$. Let $\boldsymbol{F}_{\mathbf{1}}=A \cap\left({ }_{T} V \oplus \beta\left(V_{s} \oplus V^{T}\right)\right) \oplus \boldsymbol{D}$ Now $A=F_{1} \oplus E_{1} \oplus \alpha\left(V^{T}\right)$ where $\alpha_{m}\left(F_{1}\right)=0$ and $E_{1}$ has finite rank. Next consider $V^{T}=\alpha\left(V^{T}\right) \oplus \beta\left(V^{T}\right)$. Let $T_{1}$ be the set of $t$ 's such that $V_{t} \subseteq V^{T}$ and $\alpha_{m}\left(V_{t}\right) \neq 0$. Then $T_{1}=T \backslash\{s\}$ and $\left|T_{1}\right|<|T|$. By the induction hypothesis $\alpha\left(V^{T}\right)=E_{2} \oplus F_{2}$ where $E_{2}$ has finite rank and $\alpha_{m}\left(F_{2}\right)=0$. Therefore $E=E_{1} \oplus E_{2}$ and $F=F_{1} \oplus F_{2}$ satisfy the lemma.

Remark. If $\mathcal{C}$ is the class of rank one torsion-free reduced abelian groups, Lemma 5 follows readily from the fact that $V$ and any direct summand of $V$ is coseparable (see Proposition 1.2 and Theorem 5.8 in [3]). Thus the kernel of the map $\alpha_{m}: A \rightarrow G_{m}$ must contain a direct summand $F$ of $A$ with finite rank complement $E$.

Proof of Theorem 1. By Lemma 4 we may assume $I=\omega$. We may also assume $V$ has the decomposition in Lemma 2. We wish to find submodules $A_{n}, A^{n}$ in $A$ for each $n$ in $\omega$ such that:
(1) $A=A_{n}, A^{n}=A_{n} \oplus A^{n+1}$ for each $n$,
(2) Each $A_{n}$ has finite rank,
(3) For fixed $m A_{n}\left(A_{n}\right) \alpha_{m}\left(A_{n}\right)=0$ for almost all $n$,
(4) $\cap A^{n}=0$.

Then, $\mathrm{b}_{;}$Proposition 3.3 in [4], we will have $A \cong \prod_{\omega} A_{n}$ and Lemma 4 above vill complete the proof.

Let $A=A^{0}$. If $m \geqslant 0$ and if $A^{m}$ is a direct summand of $V$, then, by letting $A^{m}$ be $A$ in Lemma 5 , we can find a decomposition $A^{m}=$ $=A_{m} \oplus A^{m+1}$ where $A_{m}$ has finite rank and $\alpha_{m}\left(A^{m+1}\right)=0$. By induction we can find $A_{n}, A^{n}$ for each $n$ in $\omega$ to satisfy (1) and (2) above and where $\alpha_{n}\left(A^{n+1}\right)=0$ for each $n$. For fixed $m \alpha_{m}\left(A_{n}\right) \subseteq \alpha_{m}\left(A^{n}\right)=0$ for all $n>m$. This yields (3) and (4) which completes the proof.

## 4. Generalization.

Theorem 6. Let $\mathcal{C}$ be a transitive class of slender $R$-modules. If $\prod_{I} G_{2}=A \oplus B$ with $G_{i} \in \mathcal{C}$ and $|I|$ non-measurable, then $A$ is isomorphic to a direct product of members of $\mathcal{C}$ if this statement is true whenever $I$ is countable and all $G_{i}$ 's have the same type.

Proof. The result follows from Theorem 1 and the following proposition.

Proposition 7 (Theorem 3.7 in [4]). Suppose an $R$-module $P$ has decompositions $P=\prod_{I} G_{i}=A \oplus B$ where $|I|$ is non-measurable and each $G_{i}$ is slender. Then $A \cong \prod_{J} A_{j}$ where each $A_{j}$ is isomorphic to a direct summand of a direct product of countably many $G_{i}$ 's.

As an aside we mention that the conclusion of Lemma 3.6 in [4] is misstated. It should be: Then $A \cong \prod_{J} A_{j}$ and $B \cong \prod_{J} B_{j}$ where $A_{j}=A \cap\left(P_{j} \oplus \beta\left(P^{j^{\prime}}\right)\right)$ and $B_{j}=B \cap\left(P_{j} \oplus \alpha\left(\boldsymbol{P j}^{\prime}\right)\right)$. The proof of the Lemma, with obvious modifications, remains the same.

## 5. Applications.

Corollary 8 (see Theorem 13 in [5]). Let $R$ be a commutative Dedekind domain which is not a field or a complete discrete valuation ring. Let $V=\prod_{I} G_{i}=A \oplus B$ where $|I|$ is non-measurable and each $G_{i}$ is a rank one torsion-free reduced $R$-module. Then $A$ is a direct product of rank one $R$-modules.

Proof. Let $\mathcal{C}$ be the class of rank one torsion-free reduced $R$ modules. Each module in $\mathcal{C}$ is slender by Proposition 3 in [5]. If $X$ and $Y$ are in $\mathcal{C}$ and $f: X \rightarrow Y$ is a non-zero homomorphism, it is a monomorphism. Hence $\operatorname{Hom}_{R}(X, Y) \neq 0$ if and only if $X$ is isomorphic to a submodule of $\boldsymbol{Y}$. It follows that $\mathcal{C}$ is a transitive class of slender $R$-modules and that, for this class, the definitions of «type» in this paper and in Definition 9 in [5] are equivalent. By Proposition 12 in [5] the Corollary is true if all $G_{i}$ 's have the same type. Theorem 6 above completes the proof.

Corollary 9. Let $R$ be a ring and let $\mathcal{C}$ be a transitive class of slender left $R$-modules such that modules of the same type are isomorphic and, for each $X$ in $\mathcal{C}$, projective right $\operatorname{End}_{R} X$-modules are free. If $\prod_{I} G_{i}=A \oplus B$ where $G_{i} \in \mathcal{C}$ and $|I|$ is non-measurable, then $A$ is isomorphic to a direct product of $G_{i}$ 's.

Proof. By Theorem 3.1 in [2] the result is true if all $G_{i}$ 's have the same type. Theorem 6 above completes the proof.

I am indebted to the referee for the Remark after Lemma 5 and for many other ideas incorporated in the revision of this paper.
